Jay Maynard ported a version of KA9Q to the HP95. It should also

work on the HP100. Any TNC that supports the KISS protocol would
be suitable. The PacComm Micropower or the Handipacket would be
good choices. I favor the Micropower since it accepts standard
TAPR TNC2 firmware and hardware add ons. The big problem with
NOS on a palmtop is that NOS has gotten fat with features and
needs as large a TPA as possible to function. By stripping out
the non-essential features, it can fit in the palmtop easily
and still allow plenty of ramdisk space for setup files and the
like. The small keyboard and screen make operating packet this
way somewhat painful, but it definitely works.

Gary

I can't comment on what might be the *best* solution, but I've used an
HP 100LX connected to three different radios, one Kenwood (an old 7950
that I dedicate to packet) and two Yaesu handhelds (ft470 and ft530)
through a Kantronics KPC3 without problems. I was running Johan
Reinalda's version of NOS (JNOS 1.08d) at the time. I recompiled the
code to remove drivers that aren't/can't be implemented on the 100, but
otherwise the code was unmodified. Please note that a RAM/FLASH card is
highly desired for any serious use of (J)NOS on the 100.

The 100LX uses a 80c186 cpu running at just under 8 Mhz.

Ron WA7TAS
crh@cv.hp.com

I don't speak for HP, just as a very satisfied user of the HP-100LX.

I've uploaded code to ucsd.edu:/hamradio/packet/tcpip/incoming and
wg7j.ece.orst.edu:/incoming to allow NOS Telnet clients to send
a teminal type to the telnet server. tnterm.txt is a short description
of the update, and tnterm.zip is a zipfile of the changed files, limited
to telnet.h and telnet.c.

Enjoy!

P.S. On wg7j.ece.orst.edu, be aware that the tnterm.gud is the good
zipfile if present, otherwise use tnterm.zip.

No there isn't. I dunno what you are expecting from packet, but full-service
Internet access certainly don't exist. If you can run a full Internet node
down a crowded 1200baud radio link, I'll be _very_ impressed. Also, I presume
you know you need an amateur radio licence for this?
Sorry to put such a dampener on things, but the packet network is a long way
from being able to handle Internet traffic, and there's also a thing called the
third-party rule which would mean you couldn't handle any traffic which wasn't
to/from licensed amateurs.. although I suppose my Linux box is connected to
the local TCP/IP net so it is in theory an Internet host.. just not connected
to the rest of the net, that's all :-)
If you want to know more, drop me an email..

>machine as an internet site as if it were a unix box ? I expect this
>is in the FAQ :-)
Hmm.. we don't actually have an FAQ, do we?? Just wondering..

Cheers, Mike

Well you'd hope so Brian. However, we used to play music over the
ID slide during the warm up period for our transmitter at sign on.
We were cited. The commission said we weren't licensed as a radio
station and couldn't play music without accompanying *moving*
video. So I wouldn't be so sure that they use good judgement
in interpreting the rules.

Gary

>
>And exactly *where* in the rules does it say that? Part 97.113(d)
>flatly prohibits the transmission of music. It does not specify a
>modulation encoding. This part deals strictly with content, and
>not the method used to convey that content.

Good analysis IFF part 97 was the only word on the subject. But it's
not. I believe the ARRL has already asked for guidance on the regulation
and have been told that "music" in that regulation means, as any
rational person would expect, music as you hear it in the broadcast
band. It does not mean other methods of representing music and does not
mean music picked up in the background when public service operators are
working a parade or music incidentally picked up from your car radio
when you're talking on the repeater.

It is common, and in fact required, that regulatory bodies give
interpretation of their regulations those interpretations aren't as
binding as the regulations themselves, but they are binding to a lesser
extent and can be depended upon for day-to-day operation.

So give the armchair lawyer act a break.

I suspect you didn't challenge the citation - for most commercial
operations, it isn't worth it for small things like that.

But I know that I'd definitely take any such citation up the ladder of
review and hearing if I thought the FCC was being arbitrary or
capricious, as is my right and my duty.

I do know of a few people who have indeed done just that - instead of
just sending in the fine (excuse me, "monetary forfeiture"), and won.

In any case where the alleged "offense" is based on an unreasonable
interpretation of the FCC regs, I'd think it would very much be
worthwhile to consider challenging it.

This isn't directly relevant, Gary, but was the citing FCC officer the
same one who is rumoured to have cited his wife for failing to identify,
and was responsible for the infamous "900 number packet message"
debacle? I ask because it's about the right part of the country....

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
    a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
    No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
    packet radio: WB7TPY@WB7TPY.AZ.USA.NA   -or-
    Internet   : david@stat.com   -or-
    Fidonet   : David Dodell @ 1:114/15

(5) Have fun. Use the gateway as much as you like. That is what it is
    there for.

From Internet to Packet

Send mail to the internet address of:

gate@wb7tpy.ampr.org

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@stat.com

Internet: david@stat.com FAX: +1 (602) 451-6135

The current rules are stricter that in the US in most parts but in
others are far laxer.

There are new rules coming though which will make it quite free and

easy in many ways. We're sorta in limbo at the moment waiting for
the damn things to be made law.

Carl.

Our university radio club has a TNC with 1.1.3 firmware. I gather that I
need to perform a modification of sorts to the tnc before I can upgrade
to any higher version. Can anyone point me towards where I might find info
regarding this modification? Any help would be greatly appreicated!

X-Newsreader: TIN [version 1.1 PL9.4]
Lines: 31

  Can someone give a summary of top external modem speeds available from
commercial TNCs? The subject line says TNC2s but I'd be interested in
AEA, Kantronics PacComm and other "custom" TNCs if they worked well.
Even if the modem doesn't have the modem disconnect connection and you
know that the digital side can handle the datarate I'd like to know
this.

  Specifically I'm trying to find something cheap to use as an
alternative to the more expensive MIO digital interfaces which N6RCE has
designed and built for use with some of the faster radios I have,
particularly at high level/remote sites.
   I'm hoping to be able to increase the clock speed by 2X (4X?) and
perhaps turn up the clock speed to the serial communications controller
chip in a TNC and get 38.4 kbps or faster performance. This is only one
tenth of what the radios will do, but having only that is better than
having radios sit unused on the bench or only beaconing at high speed.
  Are there some inexpensive alternatives to this approach which I'm
missing?
  I don't think I can afford Gracilis solutions.

  I've ordered an MFJ 1270B, which appears to be a TNC2 clone, and I'm
planning on investigating the possibilities with it myself but I'd very
much like to hear from anyone with direct experience. If another
inexpensive TNC is better I'd certainly like to know that too.

Thanks for any help.

I am not into packet yet.. but I am looking at getting a packet modem.

What are the speeds and specs on the different modems.. and what is special
about each different types..

How fast can they go??

is 19.2 max? (this is in 2m or 440 or 1.2 Ghz.. any of the three..)

and I need to know operating ranges at 5 watts. and 35 watts..

Thanks

tarjan@iastate.edu

Glenn;

I use a PacComm Micro-2 TNC with my 56K setup. The TNC runs WA4DSY's
version of the KISS code (optimized for speed). The best I have been
able to do is 56K to the modem, and 19.2K to the Macintosh. I tried
the TNC at 38.4, but it had problems with interrupts interrupting

interrupts, and then crashing (ah recursion...). The Z80 in the
Micro-2 runs at 7.3728 MHz (if I remember right). Perhaps a higher
speed Z80 (16MHz ?) might be able to handle it. Dale spent quite a
bit of time optimizing the KISS code for buffer handling, so I doubt
there is much more room for improvement there.

With the price of 68302s coming down, something like the Gracilis
solution should prove quite interesting real soon. The venerable Z80
is good, but we are just trying to get it to move data faster than
it really can (and still handle the media access tasks).

If it's "WAMPES" it's for UNIX, for a DOS box get WNOS that has a lot of
wampes bits added to it. Look in /hamradio/packet/tcpip/wnos on ucsd.edu.

Regards

Simon

I am in the process of setting up a NOS station and to encourage the use I would like to include a "user friendly" full feature
PBBS for AX25 users mainly.

Has anyone got any ideas or personal experience of the best way of implementing the link from NOS, what S/W they used (or would
use) and exactly how it would be set up. I would look if possible to run the PBBS on the same box.

Thanks

I'm about to register the domain of by BBS (a Ham-Usenet-Unix
oriented BBS in the Philadelphia area) with NIC. I'm wondering
the net has an opinion about the following questions.

Should I register as kd3bj.ampr.org , or as kd3bj.sellersville.pa.us
or as something else? Each seems to have advantages. Is there any
standard here, or should I make this up as I go along?

Also, since I'm not directly on the "real" Internet I need to
specify two systems that ARE on the Internet as mail forwarders.
When I specify my Internet forwarders, should one be on the AMPRnet
and one on the "real" Internet? I'm not sure NIC recognizes packet
stations as valid forwarders.

Is there anyone else _besides_ NIC that should be notified.

I've been through this once already, registering flam.com through
uunet, that was painless, but the Ham internet may be different.

Dear All,

     I am interested in building a TNC to use in England, with packet
radio. I am looking to set up a station initially with an Atari ST,
but later moving up to a PC or Unix Workstation. Could anyone
recommend me any books, or other sources of information pertaining to
the protocols, and coding/decoding necessary to produce a TNC.
     Please reply by email to

     cabr@eee.nott.ac.uk

     Thanx,

     Clint Redwood.

     P.S. I lose my account at the beginning of July.

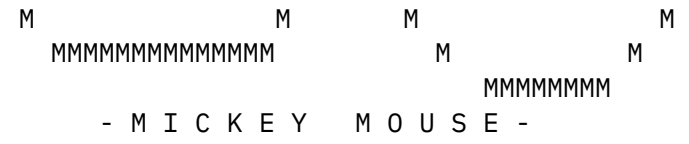
How does one apply for an amateur IP address (for a gateway)?



Thanks.

MiniSport Laptop Hacker - Vol 6A   14 Dec 92

You folks have been great! The incoming information is cascading. I am
anxious to assemble some of the ideas and send the next volume out. Every-
thing from using kids' foam blocks for briefcase padding to add-on jumper
mods to the back of the circuit board. I have all the back volumes avail-
able to copy onto disk, too. I've had several inquiries. Send me a disk
(3" or 5") and I'll get it back to you. Please include a SASE to keep this
low-cost for me.

The unexpected news, however, is related to my real job. I fly for the Air
Force and I'll be departing tomorrow for you-can-guess-where. The plan is
to be back the first week in February. That's why this issue is manually
typed in as 6A. 6B will be the "real" Volume 6 by the time I get back.

Not the least of folks to thank is Chuck, WB7NNF, who hosts me as my home
BBS. I just was reminded that he has been manually forwarding my ALLUSA
bulletins. I think his outbound links are running automatically again, but
you sure might send him (or your own home BBS sysop) a thank-you for the
custom work.

SB HACK@ALLUS
MiniSport Hacker - Vol 6B
MiniSport Laptop Hacker - Vol 6B
8 Feb 93

Thanks to KA9SWW, N8LUF, KA9CAP, N7FTM, N8NUY, WJ8T, and N9KRS for sending me information (I don't know it all) or queries (I know what people are interested in). Special thanks to WB7NNF (my home BBS) for taking care of the inbound mail while I was out of town!

>>> CULTURE
Boy, is it great to be back! Even with all the trouble we have as a country, I am again convinced there is none better. Be glad you live here! My trip to Saudi Arabia was educational. I got to refuel the F117 Stealth Fighters pre- and post-strike on the January raids and got to see real capital punishment in action. The Saudis execute criminals in the downtown square by kneeling them down and slicing their heads off with a huge sword. That is something that I needed to witness only once.

>>> ADMINISTRATIVE
MLH Volume 6A was notice saying that I would be gone for a couple of months. Volume 6B resumes the normal style, and from here they will continue to be numbered sequentially.
.
I've received a number of requests to provide back issues of ML Hacker. I don't want to inappropriately burden the packet networks, so I've hesitated sending back issues to everyone that asks. I could see this getting out of hand when somebody sees Volume 23 and asks me to send the preceeding 22!

Pending recommendations from my local host sysop, I'll go with the following policy. If you're a sysop (your callsign is the first in the message routing), I'll send back issues through packet so you can post them to be downloaded locally. For other individuals, I've got three options. I'll 1) send them to you on disk through the mail or, 2) via packet to your host sysop if he/she asks, or 3) over landline Internet. If you use the disk method, send me a disk and postage to get it back to you. My address is Brian Mork, 6006-B Eaker, Fairchild, WA 99011. I moved in fall '92, so older callbook addresses are now obsolete. If you use the Internet method, query me via ka9snf@visual.spk.wa.

>>> ACQUIRING YOUR OWN

I started the MLH series as a forum for owners. This was an incomplete goal. A number of folks are reading the series to determine *if* they should buy one! The general concensus is that the ML is serving a lot of people well. The pros are definitely out weighing the cons.

.

My 2Mb ML accompanied me to Saudi Arabia and survived 2 months of being banged around in a soft case briefcase. I provide some cosmetic barrier by putting it inside of a lawyer legal size fanfold folder. I carry extra disks (2" and standard sizes), null modem cable, male/female cable convertors, power supply, and parallel printer cable. This has to be the essence of the laptop. With a "software" TNC and small handheld, you can't have much more of a portable packet station.

.

In September, I made an 18-hour non-stop car trip from Merced, CA to Spokane, WA. I had a PK232, an FT-290, and the MiniSport on the passenger seat. Boy did I have fun! I used a 5/8 wave whip on top of the car and had range enough to log onto several BBSs while passing through. It was a bizarre feeling to be linked into the amateur networks while travelling down the road. That day, the Shuttle happened to have just launched into orbit and I listened to status updates on local 2M repeaters. When I got into Oregon, word was out that they were up on packet. I tuned up my mobile system and listened. I heard two orbits overhead, although the signal was too weak to copy. With planning, you could do mobile packet into outer space. What technology we have at our finger-tips!!

.

By far the biggest problem with the Minisport is with power supplies. The Li batteries cause a lot of grief. Weak or dead batteries have causes serial ports to fail and have caused AC power supply output problems. If you have mysterious problems, pull both the NiCad and the Li batteries for several hours. Buy new Li batteries (RS 23-166) and fully charge the NiCads.

.

Prices are between the buyer and the seller. For guidance, I'll throw out a few numbers. I was fortunate to buy my MLs from a primary source. Working computers were $50 or $100 (1 or 2Mb). Non-working were $30 or $75. Power supplies were $30. No docs. No guarantee. No returns. Cheap, but harsh! I spent an entire Saturday (5:30am to 9:30pm) driving to Benton Harbor, MI and back home. In following weeks, car loads of people were dropping in on Surplus Trading Corp. I've been informed they have no more.

.

A secondary level of surplus dealers is offering them in the $200 range with a 90-day warrantee. One of the first dealers in Michigan to sell them

at hamfests was selling them for $100 or $200 with no power supply. They were dumped on the surplus market in Michigan and seem to be most plentiful in the Midwest. Current prices hover around $150 to $200. The 2" floppy disks are expensive: minimum $4 before postage, etc. Try Rex Television (Worth, IL, 708-448-5558) or R&R Computers (Bellbrook, OH, 513-848-4681).

>>> SIMPLE HELPFUL INFORMATION
Your contributions to the MLHacker don't have to be complicated or technically superior. I knew that CTRL-ALT-DEL would reboot the system and allow access to SETUP if the ESC key was pressed. I now know that CTRL-ALT-INS will bring up the Zenith monitor (pre-boot) program without having to pounce on the ESC key. Little things like this help those of us without manuals.
.
Does anybody have a Tech Ref Manual (Zenith part 595-4354)? How much did it cost? Several people have indicated they have other manuals. Is it ok to pass your name onto others so they can contact you?
.
I will transfer information from/to the 2" disks for people if you make it a no-cost operation for me. Send me the necessary disks & return mailer/postage, etc.
.
If you let the NiCad batteries drain, your Lithium batteries will be drained in a very short time. Use the NiCads until you get the red light blink & beep, then charge it up all the way! From experience, I know that 2 months of inactivity will drain the NiCads and the Lithium batteries.

>>> UPCOMING
COMM & PARALLEL LINKS, SHRINKING YOUR FAVORITE SOFTWARE, MINIMUM BOOT FILES, BOARD REVISIONS, and more DISASSEMBLY and PINOUTS.

MiniSport Laptop Hacker - Vol 5, 3 Dec 1992

Yea! I've gotten a few more technical responses from the audience. I'm never sure what people are most interested in. Usually a discontinued, but useful computer attracts a cadre of hackers to support it. I initiated this series in an effort to provide a single point resource point. Keep sending the tech info!
On the flip side, I'll bet there are a lot of first-time MS-DOS users who have purchased this machine because of its "out of production" cost. Let me know what information you need to make this thing useful in your Amateur Radio quests. Owning it is only half the battle. Be sure to *use* it to its full potential.

>>>DISASSEMBLY INSTRUCTIONS Remove the battery. If you'll do more than remove the back panel, I suggest removing the Li batteries, too. If you remove the main battery pack and the Li batteries, you'll loose all RamDisk info and configuration info. Back it up first!
There are 12 phillips screws holding the back of the computer in place. Remove the 5 around the perimeter of the bottom. Notice that one rubber foot has no screw. So as to not snap plastic, remove the 2 screws holding the modem cover in place. Remove the modem cover. Loose the 4 scres holding the handle of the computer. I leave these in place as the back panel is lifted off. Lastly, don't forget the single screw on the back panel (not bottom). It is the one farthest from the flip down access panel on the back.

Once all 12 screws have been loosened or removed, lift the back cover straight up. The oval Li battery cover will remain in place. There's a plastic insulating sheet attache to the inside of the bottom cover. Be sure not to dislodge or crease it as you lay the back cover aside.

Another dozen screws allows the circuit board to come up. For reference, lay the computer upside down with it's back toward you. Remove the 3 screws across the top (the front edge as it lays). The two metal brackets on each side are held down by two screws each. Remove these 4 screws, as you notice the orientation of the metal brackets. Right in the center, there is a single screw holding down a grouding tab. Remove the 1 screw, and the tab if it appears to be loose. The next 3 screws are *inside* of the flip down accessory panel on the back. They're tiny. Don't loose them! The last screw actually is one of four that mount the disk drive in place. It must be taken out to loosen the silder and copper colored grounding straps that curl up around the right side of the circuit board between the power switch and the disk drive.

Disconnect the ribbon cable that overlays the copper colored foil you just loosened. *Carefully* note how the power switch, the ribbon, cable, the ferrite choke (if present), and the disk drive are arranged. This is the most difficult part to get alligned correctly during reassembly.

As you lift the lower right side, depress the power switch so you don't break it off! The eject button of the disk drive also needs to be pressed in as it passes past the thin plastic strip of the computer case blocking its path. The power switch and disk eject button need to be caressed during reassembly, too, simultaneous with holding the ribbon cable and ferrite choke on the cable in place. Do you have three hands?!

While rotating the entire board a little clock-wise (to release the plastic clip extending out from the battery enclosure), lift the left and front upward. The circuit board and the keyboard will be free. The keyboard must be lifted out at the same time or the green acetate ribbons curling around the left side of the circuit board will be strained. *Although the keyboard and the circuit board are not connected, they must be handled as one unit while the acetate ribbon cables are connected*

As you lift out the keyboard/circuit board pair, you'll find they're still connected to the rest of the computer on the back (bottom as you look at it). I find it convenient to open them like a clamshell and set the computer on its side. It stands up all by itself like a birthday card.

>>>POWER PINOUTS
More info on dissembly next time if folks are interested. For now, back up to when you just pulled the back panel off.

Just below the center circuit board hold-down screw, there is a double row of 8 pins (bottom view of a 16pin mini Scotch flex connector header). Pin 1 is toward the right and front of the computer. As you look at it:

```
    15 13 11  9  7  5  3  1                    1  2
    16 14 12 10  8  6  4  2    or rotate CCW:  3  4
                                               5  6
A working power supply provides the            7  8
following voltages:                            9 10
                                              11 12
  1:  5.1     2:  5.1                         13 14
  3:  0.0     4:  5.1                         15 16
  5:  5.1     6:-22.1
  7: 10.3     8:-10.4           When my system quit working, it consistently
  9:  0.0    10:  6.6         failed with the following indications:
 11:  0.0    12:  5.1                  pin  5:  0.0
 13:  0.0    14:  0.0                  pin  6:  3.9
 15:  5.1    16:  5.1                  pin 10:  5.7
```

Well, I have gone way over my self-imposed one page length! Oh, by the way, if you're looking for an excellent "cram it all onto paper" utility that lets you document packet work, consider tcols, distributed with the shareware A86 assembler. I'm currently evaluating version 3.21 (off of CDROM, available to you, as indicated in MLH Vol4). Tcols appears to be a unix clone, accepting parameters of line width, length, number of columns, etc. I run my printer at 160 characters per line (12cpi condensed) and pack in 8 lines per inch. That's how I archive all the good info you folks send me.

Next time, MINIMUM BOOT FILES, BOARD REVISIONS, and more DISASSEMBLY

and PINOUTS.

MiniSport Laptop Hacker - Vol 4   28 Nov 92

A few more folks checked in since the last issue. It was good to hear from KI6PL, N8OWM, N8PJP, KU8H. These volumes come out pretty spuratically. That's why they're labelled Volumes rather than Parts. Each is put out on the network as I have info to fill it. Be sure to send me *your* information! The rumor mill suggests a large pool of these machines is becoming available in the Michigan area at reasonable prices. That should provide a much bigger pool of users to swap information. Good!

One of the best purchases I've made recently is a CD-ROM. I survive with one Ham radio related disk and one shareware distribution disk. Any of the programs I refer to are likely sourced by these two CD-ROMs. I would love to share them with you, and it's encouraged by the program authors. Make it painless for me (disk SASE, clear request, etc) and I'll make copies for you. If you're a "want it now" type of person, we can do a phone data transfer.

>>> FLOPPY DISK SOURCE The strange 2" floppy disks problem seems to be a perennial concern. Here's all the non-rumor info I have. Rex Television Service Co (7030 W. 111th Street, Worth, IL 60482-1827) sells a 10cnt box for $45.00, but then tacks on another $10 for freight. They also tried to get me for sales tax, but refunded it later. Phone 708-448-5558. The box I have indicates a lifetime warantee from FUJI, with the following Point of

Contact: Fuji Photo Film USA, Inc., 555 Taxter Rd, Elmsford, NY 10523.

>>> FILE TRANSFERS I found COMMO and DSZ will work together on the MiniSport for what I need in less space than PROCOMM takes. This allows packet (or modem comm) with ZMODEM, YMODEM, and XMODEM protocols. I tried using DSZ with a hardwire between computers, using a null modem cable (FWL, which is on your disk C:, is faster. Don't ask why I do these things!). DSZ did not like the 3-wire null cable I described in MLH Vol3 that works with FWL. It needed to "hear" the CD (Carrier Detect) on the serial port. Trying to stay as globally portable as possible, here's a full blown null modem cable that lets you plug into almost any IBM/PC/XT/AT/'286/'386/'486/? that you may come across.

```
 {9fem}--------4' 7cond cable------({9fem}----- 5" 7cond cable----{25male})
-------------------------------------------------------------------------
 0 (0 1)        DB-25 Frame Ground is not used
 1-6 (1-6 8-6)  Each feeds it's received DSR into CD, also
 2-(3-2)        Data to loner
 3-(2-3)        Data from loner
 4-(6-6)        DTR from loner goes to others' DSR
 5-(5-7)        Signal Ground
 6-(4-20)       DSR to loner from others' DTR
 7-(8-5)        RTS from loner to others' CTS
 8-(7-4)        CTS to loner from others' RTS
 9 (9 22)       Ring Indicator not used
```

The numbers to the left are pin numbers. Wires are represented by "-". In the text description, "loner" refers to the computer at the lone connector end.

DSZ supports much more widely-known protocols. For that reason, it has been important for me to get running. It's still in an evaluation stage at this QTH. If you have any experience with this program, I'd be interested. But be assured that Zenith did you well by providing FWL. It is an order of magnitude faster for local hard-line transfers. I've not tested FWL over the phone line.

SWAPPING THE SECOND MEGABYTE
I had two MiniSports. The 2M one had a power supply problem. It would work work for a week or so and then no longer power up. Each time, I took it apart, wiggled all the connectors, put it back together and it worked. The fourth time around I decided "enough!"
I unsoldered the single-inline-pins of the add-in memory package (8 bits by 1 Mbyte). I resoldered into the same position in a second machine that was working reliably as a 1M system. The memory package's pins are not actually the pins of the ICs, so I wasn't too worried about heat damage. I used an alligator clip between the soldering iron and the computer ground.
No jumpers, solder traces, etc needed to be modified. I reran the SETUP option (hold ESC on power up), specified new memory sizes in both, and, voila!, they both have worked fine now. I'm still waiting for the old 2M to fail again.

If you have any supply information on 1Mbyte x 8bit SIP (or SIMMs, I'll add

the pins), please let me know! I'm confident that I and other hams can successfully double the memory in a 1Mbyte version of the MiniSport.

Next time, DISASSEMBLY INSTRUCTIONS, POWER SUPPLY PINOUT, MINIMUM BOOT FILES, and discussion of BOARD REVISIONS.

Was speaking to a rep for ARRL and they said the FCC is considering setting up larger band with area just for HighSpeed TNC's. But it would be in freq range limiting distance. But not exactly sure...

can anyone fill this in?

At a packet meeting last night, an amateur suggested writing an AX.25 packet
driver for a soundblaster card to do 1200, 4800 and/or 9600 baud. This
sounds like an excellent idea: no TNC, no modem, just plug the rig into
the soundblaster.

Has anybody thought of this before? Is it plausible? etc etc.

Cheers,
     Warren vk1xwt

In the sense that there is a DC component. I've got no idea what's the DSP
chip on the card, vague memories of a TMS DSP chip. Maurie Daly VK1MD came
up with the idea. He's now after C libraries to access the DSP chip on the
card.

I'm (almost) sure it is possible to write the software to make AX.25
on a SoundBlaster card but the one _with_ a DSP on.
Without a DSP you may not have enough processing power to analyze
in real time the voice data (8 ksamples/sec ?).

>|> How much control do you have over the phase? And 4800 and above is
>|> not exactly audio modulation anyway...

It is still audio but to avoid phase/frequency distortions you
connect directly to phase/frequency modulator/discriminator.

>In the sense that there is a DC component.

I believe there is no DC component at 4800 due to "tricks" the modem does.
At 9600 the DC is removed by the scrambler I think (but not sure...)

I am interested myself in the idea but the SoundBlaster with a DSP

costs here around $500 :-(so I'm still waiting for the finish DSPCARD4...

Pawel

I've been trying to get an IP address (44...) for myself for a short
while, and supposedly the coordinator for my area (South central lower
Michigan, but I like to call it "Lansing") is WB8WKA. Assuming that he
doesn't read r.r.a.p (I'm not ruling that out), how can I get in touch
with him electronically? I suppose I could look up his callsign in the
trusty callbook, and send snail-mail, but I'm into instant gratification! :-)

Thanks to anybody who can give me some info.

: sounds like an excellent idea: no TNC, no modem, just plug the rig into
: the soundblaster.

: Has anybody thought of this before? Is it plausible? etc etc.

I have looked into it, but have not had the time to get it going. What I do
have going is sound card SSTV, which has most all the pieces. I have gotten
the source to Poor Mans Packet (PMP) and have looked at modifing the routines
which deal with the audio circuitry, but due to a somewhat overloaded
schedule, have not actually tried it.

It is quite plausable, and should work. If your PC is fast enough it should
be possilbe to do some pretty fancy modulation, although the decoding will
get to be a headache.

At Dayton I picked up a piece of software which does SSTV using a soundblaster.
It should be possible (perhaps even simpler) to handle the sounds for packet...
Interesting idea!!!

This is probably the NPRM concerning 219 MHz. The idea is to *share*
the band with the Watercom system. By careful coordination and siting,
it should be possible to set up fixed point to point links that don't
interfere with existing users. The ARRL Lab did some experiments to
determine the potential for interference to channel 13 TV in support
of our petition. Range should be as good as 2 meters. While the

aperture of the antennas used is often a little smaller, I think the decreased noise tends to make up for it.

If you are thinking of the higher microwave bands, I'd recommend 10 GHz. Perhaps the best known band between 2 and 24 GHz. Waveguide is a convenient size for most people. A lot of surplus is available, and you can buy new equipment is well. But, there doesn't seem to be much actually operational, though Glen Elmore has written up a system using 10 GHz Gunnplexers in the ARRL Handbook. But, it really isn't popular yet. Perhaps the recent distribution of circuit board artwork will help.
Or maybe someone needs to sell complete plug and play units?

6 GHz might be the best band for a skilled microwave expert. High power surplus equipment is available in the USA (maybe I'll get that 10 watt amp I just bought in time to use on Equinox this weekend). Problem is, variety abounds. Thus, units may look the same on the outside but might be totally different inside. I guess engineering changes aren't unusual for high priced microwave equipment. RF safety become a real concern--you can't be casual around 10 watts+. TWTAs aren't for the careless either, combining both high voltages and high RF levels. But, if you want to set up 300 mile troposcatter links, its worth considering.

2.3 GHz and 3.4 GHz are actually more expensive than 10 GHz, due to the lack of big consumer type markets (radar detectors, automatic door openers, etc.). There is commercial development of 2.4 GHz unlicensed devices that may reduce the cost, but it doesn't seem to be here yet. Since the typical application of a high speed link is point to point, 10 GHz is actually better, since you can get more gain for a given size antenna (e.g. 2 foot dish), and actually get better signals.

Why not lower frequency Gunnplexers? Actually, they are available, but the voltage requirement increases as the frequency drops. Since 10 GHz just manages to work OK with 12 volts and a regulator, lower frequency devices are shunned by many amateurs.

No, it's a specialized Japanese (Hitachi? My SB is at home) chip. It's
not a general-purpose programmable DSP chip.

To do this, you'll have to do the modem DSP algorithm on the PC itself.
That doesn't mean it's impossible, but it may limit you to simple
modulation schemes (FSK, for example). I haven't actually done a modem
for the SB, although I've thought about it.

Also, the SB can't transfer data between the PC and the SB in both
directions at the same time (one DMA channel). I understand the
new 16-bit board is more capable, but I don't know the details.

Of course, you'll also need a BAYCOM/PSP type software TNC program to deal
with the AX.25 stuff.

I could be wrong, but I think the use of the phrase "DSP" in the
context of a Soundblaster is a bit of a misnomer. I talk to one
under 386BSD, and it seems to be just a D/A & A/D with anti-aliasing
filters, no real DSP (unless you count some canned compression
algorithms which sound lousy). There is a FM sound chip too which
can crank out ADSR style tones.

But a 386/486 is still capable of doing quite a lot of number
crunching on the raw data supplied by a soundblaster. Being
entirely digital, you would have complete control of phase &
amplitude.

Lines: 16
Message-ID: <1v5ithINN4aj@network.ucsd.edu>
NNTP-Posting-Host: nothing.ucsd.edu

I'm playing with some high-speed digital data transmission (under a Part
5 license, so ham regs don't apply), and I'm considering boosting the
speed on a DSY modem. Bisbee tells me that he's made the standard GRAPES
kit run at over 115 kbit simply by using a fast EPROM in place of
the standard one and fiddling the clock rates; I assume that the DACs
are the next item to hit the stops as I increase speed.

I've come across a bunch of really really fast EPROMs (25 ns access
time) and I believe I can get faster pin-compatable DACs. What are likely
to be the next showstoppers in the standard DSY design? The IF filter?

I'd like to get the thing up to at least 256kb/s, and 1 mb/s if
possible.

Any ideas?

I remember seeing an article somewhere that some crazy programmer with

alot of time on his hands was looking to do this on an Amiga using the
built-in sound chips and an audio digitizer. Seems to me that this is an
extremely tedious task considering the cost of a 1200 baud TNC. I think
he certainly felt it was possible though.

MiniSport Laptop Hacker - Vol 3   19 Nov 1992

Thanks for all the feedback! I heard from W4NQB, N2BQF, W6QJM, NI9X,
N2PBU, N9LNO and KB1UM. Several comments indicated that the discussion of
COMPSEC, boot drives, etc was too complicated or too confusing. I'll give
a clearer, more concise rendition in the next volume.

In this issue, two topics are covered:
 1. Building your own null modem FWL (FastWire Link) cable.
 2. Discussion of "extra" DOS files Zenith put on your disk C:

1)
If you have a MiniSport, you *need* a null modem cable to make the computer
useful. You can purchase a null cable for about $10, but if you're a ham,
you probably have parts to make your own. A cable with *three* terminating
plugs adds tremendously to the convenience of hooking up to unknown "host"
computers you may run across. The following diagram shows the way I wired

one that has worked for me:

```
   9-pin fem --------- 4' ---------- 9-pin fem --- 4" --- 25-pin male
      2                                 3                    2
      3                                 2                    3
      5                                 5                    7
```

Hook the lone 9-pin into your MiniSport serial port and then use either a 9-pin or the 25-pin connector on the other with the host MSDOS serial port. Of course, the host could just be another MiniSport.
FWL will work successfully with this three-wire cable. The on-line help indicates that a full 9-wire null modem will allow faster transfer due to hardware handshaking. FWL checks and brings up the transfer speed to the maximum possible. This 3-wire cable is sufficient, however.

2)
I believe the following to be a complete list of extra "Zenith special" programs that are resident on your ROM drive C:. If you've never looked at this list before, you're probably missing some fun! I have no manuals for any of this. The comments I'm making are from experimentation only. If you have manuals, copy this list, make corrections to my comments and send it back to me!

- APPLY.COM - Repetitive DOS commands by typing on the changing part.
- BOOTF.COM - Lets you reboot the system from floppy.
- EMM.SYS - Expanded Memory Manager (I use all mine as a drive, however)
- FWL.EXE & FWL.HLP - FastWire Link to transfer to and from another computer. * C a u t i o n * Don't port FWL over to a computer that has a disk partition beyond the original 32 MByte MSDOS limit. I did this and succeeded in scrambling the directory when that computer received files. The only safe way to transfer to a 32 MByte+ formatted machine is to use only floppies for the transfer, and then do a local copy from floppy to hard drive.
- GDU.EXE & GDUTSR.COM - General Disk Utilities. They work on other machines, but I have not figured out how to use the TSR version.
- MACHINE.COM - This lets you make "post bootup" changes that otherwise would have to be made with the SETUP utility prior to boot.
- NOSTACK.COM - I'm not sure what this does. Any comments?
- SEARCH.COM - A global (all directory) search for a filename.
- ZCACHE.SYS - A disk cache program. Has anybody ported this to other machines?
- ZDIR.SYS - A complete, but compact directory (dual columns). Port works.
- ZSPOOL.COM - A printer spooler. So how is this so much better than the old fashioned MSDOS PRINT utility?

And these are the MSDOS 3.3 files you *don't* have:
- EGA.CPI
- FASTOPEN.EXE
- FDISK.COM
- GWBASIC.EXE
- RAMDRIVE.SYS
- SHARE.EXE

I recently succeeded in unsoldering the 1 Mbyte SIPP from one computer and grafting it into a second. More info on that, squeezing a lot into a 2 MB ramdrive, and a clearer description of minimum boot files -- in Volume 4.

MiniSport Laptop Hacker - Vol 2

Remember to send me any hacker tips, resources, addresses, etc that you have so I can include them in subsequent MLH volumes. One correction from Volume 1 has been pointed out to me. The MiniSport is an IBM/XT compati-
ble, not an IBM/PC compatible

I. MAXIMIZING BOOTUP CONVENIENCE AND MINIMIZING BOOTUP DISK SPACE

The bootup sequence on this computer is a little different than you're probably used to. Most MS-DOS computers will boot up on hard drive C:, looking for the CONFIG.SYS and AUTOEXEC.BAT files in the C: root directory. If the CONFIG.SYS isn't there, nothing special happens. If the AUTOEXEC.BAT isn't there, you will be prompted for a time and date entry.

The first, biggest difference on the MiniSport, is that you can choose your boot device. Normal MSDOS always tries the first floppy, then goes to hard disk. With the MiniSport, you can choose to boot from 2" floppy disk, the internal ROM disk C:, the external floppy disk plugged in the back, or ROM disk D:. Lots of choices!

The least used is probably booting from an external drive. I know where they are available for about $125, but this price is higher than the street price of the entire computer, so not many people have them. Booting from the built in 2" disk is similar, and more economical, since these disks are available for $4-$6 each. With either selection, the disk must be formatted and prepared with the MSDOS SYS.COM utility.

Booting from RAM disk D: gives you some flexibility. You can create and store CONFIG.SYS and AUTOEXEC.BAT files in the root directory of D:, and they'll be used during bootup. If AUTOEXEC.BAT is not there, you will be asked for date and time. The situation involving CONFIG.SYS is a little bit more complicated, however. If you boot from D:, the boot routine will look for a command processor (COMMAND.COM or one of your choice) on disk D:. It's kind of disappointing to have to keep a copy on disk D:, since there's one permanently available in ROM on disk C:. To use the one over on C:, the non-boot disk, you need to include a SHELL command in CONFIG.SYS. It might look like this:

```
SHELL = C:\COMMAND.COM /P
```

The "P" option tells it to stay permanently in memory; the MSDOS command EXIT will not exit from the command processor. This gave me some trouble because the COMPSEC variable (type SET at the DOS command line to see all variables) was not getting properly set. This may be a bug in the MiniSport firmware. Does anyone else notice that when booting on C: or D:, specifying or not specifying a command processor with SHELL, COMPSEC doesn't get set correctly?

My preference is to boot from ROM disk C:. The unpredictable part is that when booting from C:, AUTOEXEC.BAT and CONFIG.SYS from disk D: are used. In this case, no SHELL command is required (hence no CONFIG.SYS file unless you need it for other reasons) since COMMAND.COM is already available on the default boot disk. The only line "necessary" in the AUTOEXEC.BAT file is "d:" to switch over to disk d: for the first command line. Even that is only necessary if you *want* to be over on disk D:

Personally, I use no CONFIG.SYS and the following AUTOEXEC.BAT on D:

```
@echo off
echo BjM (Opus-OVH) P autoexec.bat
path c:\;d:\util;d:\
prompt $p$g
verify on
d:
```

Let me know what parts of the MLH series are useful to you. Pass on your hints and pointers so others can benefit.

MiniSport Laptop Hacker - Vol 1

As some of you may know, Zenith has gotten out of the business of selling personal computers. I had the good fortune to purchase some of their extremely small MiniSport laptop computers. They are absolutely perfect for packet use and in any RACES or ARES setup, they could provide other functions as backups due to their universal hardware platform. I thought others might be interested in information I've collected in case you're using one or interested in buying one.

If *you* have information, please pass it on to me. I'll bundle it up and send out a MiniSport Laptop Hacker Part 2!

These computers are basically an IBM/PC platform with 1 or 2 Mbytes of RAM, MSDOS 3.3 in ROM, a 2" floppy, and a 25x80 column LCD screen. RAM above 640k can be used for EMS or battery backed RamDrive. They have connections for an external CGA monitor, an external floppy, serial port(s), and a parallel port. Primary connection to other computers is via a 3-wire or 7-wire (faster baud rates) null-modem cable. FastWireLink program is included in ROM with MSDOS, logically on drive C:

The 2" disks are hard to locate, but I finally found a source for them, albeit an expensive and un-friendly one: Rex Television Service Co., phone 708-448-5558.

I had a power supply problem with one. I unscrewed the case and innards of the offending unit and learned a lot. The interior is modular and easy to work on: Power supply, Main CPU board, Keyboard, Disk Drive, and LCD display. Multiconductor ribbons connect the parts. If you open yours up and slide the main PC board out, be carefull of the POWER SWITCH and the disk drive EJECT BUTTON. Both get caught easy on the case and might snap some-

thing. The only tricky part is that one of the drive mounting screws needs to be unscrewed before you can release a thin piece of copper ("Mu metal") colored grounding strap wrapped up and around the main PC board from below.

Like I said, I had a power supply problem with one. To the best of my knowledge, it's an intermittent cable contact. Each time it fails, unconnecting & reconnecting the one PS cable fixes the problem. It's a 15 min operation and is not complicated. I'm thinking of swapping power supplies around. I have the pinout of the PS connection to the main board, if you're interested. You could test the PS by only taking off the bottom computer panel and measuring voltages from the "underside" of the circuit board.

The unit is powered by a removable battery that reminds me of a cam-corder battery. It's advertised to be 6v. I suspect it's five NiCd cells (5x1.2 => 6.0). The computers power supply/ charging receptacle is on the battery pack and feeds connections further into the computer. I've tapped into the wierd shaped connector with paper clips. Alternately one could bypassed the battery entirely by clipping alligator clips onto the sliding contacts on the computer. The batteries will charge with a 6volt supply, but the computer runs from 9volts DC if it's not using batteries.

As I hinted above, a second serial port is available. It's logically there, but terminates mechanically in a Scotch-Flex type socket. It's meant to accept a modem module. I'm currently trying to determine a pinout for this connector. If you have the information already, perhaps you could pass it on to me.

The external floppy drive connector has been as difficult to find as the 2" floppy disks. It is a square outer connector, with a female D-shaped receptacle. The D-shaped receptacle has 20 pins. It's just under 3/16" tall and just under 5/8" wide (at the wider side of the D). If you have any PINOUT OR ACQUISITION INFORMATION for this type of connector, please send me a message and I'll include the information in round 2 of the MiniSport Laptop Hacker.

>possible.
>
>Any ideas?

     I looked at much the same thing a year or so ago. At the time, the
     cleanest way to get to 1 mBit/sec using the same technique the DSY
     uses to encode MSK (ie 64x table lookup waveform generator) was to
     dump the discrete prom/dac approach and use a cheap VGA style ramdac.
     The idea is to use the "R" output of the ramdac for "I" and the "G"
     output for "Q". Counter + some steering logic to control the phase
     of the outputs. It is possible to get ramdacs anywhere up to
     400 mHz clock rates. BTW I never pursued the "turbo" retrofit to
     the DSY after my investigation of fast data radio led me to a whole
     bunch of interesting literature on multipath.. After reading most of
     what I found on the subject, getting the bits onto the air at 1 mHz

     seemed the least of the problem :-) IEEE trans on Vehicular Technology
     usually has a bunch of good stuff on digital radio. Good luck!

I'm looking to build a TNC/node item/diagnostic tool with the help of
a local radio club. The CPU design is no problem. I'm planning to use
the Zilog SIO part for the USART. I've looked at the AEA PK88, TAPR
TNC2
and Pac-Comm modem solutions. All are simple but have an unfamiliar
clock recovery circuit. I don't want to copy their designs as I'm
afraid
of copyright violations. Is there a textbook solution???
  Please send hints or solid info.
     Thanks.

There is no DSP chip on Soundblaster. It is an A/D and D/A on a card. If
this seems pricey for that remember what you are paying for is the software.

I'm looking to get into packet basically for internet access. I've
been searching around for FAQ's, but I can't find one for this group.
Is there an ftp site that carries it ?

What I want to know is, is there a packet<->internet gateway placed
reasonably close to London ? And if not, how viable is it to run my
machine as an internet site as if it were a unix box ? I expect this
is in the FAQ :-)

Simon.

I have a Kantronics UTU-X/P HF TNC that I bought a few years
ago at a hamfest for next to nothing. I bought it for RTTY
listening (watching?), and it works fine for that. Now I am
interested in VHF packet, and I am wondering if it is possible
to upgrade this unit to 1200 baud for VHF use. Could an EPROM
change do this, or is the 300 baud modem circuitry (really
a couple of software-programmable switched-cap filter chips)
fundamentally incapable of working at 1200 baud?

If I really should spring for a real VHF TNC, could someone
tell me what units to look for or avoid? It would be nice
to have KISS mode for TCP-IP, but I really want to spend as
little money as possible. Since I already have the HF unit
for RTTY, morse, etc, I don't need to pay for these features
a second time.

Is there a FAQ for packet? All I know is what I read in the
ARRL Operating Guide (which is a very handy book!).

Thanx,

Here's one I saw earlier:

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
    a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
    No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
    packet radio: WB7TPY@WB7TPY.AZ.USA.NA   -or-
    Internet   : david@stat.com   -or-
    Fidonet   : David Dodell @ 1:114/15

(5) Have fun. Use the gateway as much as you like. That is what it is
    there for.

From Internet to Packet

Send mail to the internet address of:

gate@wb7tpy.ampr.org

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@stat.com

In Article: 4857 of rec.radio.amateur.packet
wkt@csadfa.cs.adfa.oz.au (Warren Toomey) writes,

At a packet meeting last night, an amateur suggested writing an AX.25 packet
driver for a soundblaster card to do 1200, 4800 and/or 9600 baud. This
sounds like an excellent idea: no TNC, no modem, just plug the rig into
the soundblaster.

Has anybody thought of this before? Is it plausible? etc etc.

Cheers,
Warren vk1xwt

A company called Willco Electronics has a DSP card called
the "Ham Blaster" that can run modems and interface to Packet
TNC's and software like Baycom, for example. Their address is

I am in need of guidance in the proper setup of my packet station for
NOS version 2.0m.
So far I have been able to set up the statio, get my ip number, ping
other stations, connect to other stations as long as I provide the
IP address number.
What I need help with is setting up the domain files, the ftp user files,
and the mail forwarding parameters so that the system will "automagically"
look up the correct station, forward mail, ect....
I you have any example files, and where in the /nos directory structure
they go, please email me at the above address.. Thanks and 73's

The advantage of the Soundblaster (the Pro, actually, the others don't have

a DSP chip) is that you can use it for other things, and you don't need a TNC.

Anybody know what DSP chip is in the Soundblaster Pro?

Thanks,

I am about to embark on a project that envolves the use of microwaves
to transfer digital data. Not being very experienced in microwave
technology I have a few questions to ask the microwave gurus. First,
a little background: This project will link two computers together
through their serial ports at initially 9600 baud but later at speeds
of up to 115K baud. The eventual goal is to use SLIP through this
connection to get onto the network. The distance will be approx.
10 to 15 miles.

1. Where is a good place to get cheap microwave components from?
2. What frequencies can be used for this microwave link? HAM?
    Are there allocated frequencies for such experimentation and
    do they require a license?
3. If I want full duplex, do I need 2 antennas at each end or can
    one serve as a bidirectional with 2 separate frequencies used?
4. Can one antenna be used to transmit AND receive (related to question
    3 and 5).
5. Which antenna do I use? Horn? Dish? (related to question 2 about
    frequency).
6. Has this been done before with personal/amateur setup?
7. Where can I find out more info on this stuff?
8. What security considerations are necessary? I will probably want

    to encrypt/scramble so eavesdroppers can't get system passwords etc.
    Is there data encryption on a chip available?
9. Is it feasable to use data compression or correction like v.42 and
    v.42bis? I have seen it on a chip but have never used it before.
    Are these chips very expensive? Is there a real easy way to error
    correct that's cheap?
10. Since I'll be using SLIP at my end I guess the other end can be hooked
    up to any machine on the network? (ie. a SUN, but what about an
    IBM PC or Amiga that is not running UNIX?)

I know this sounds really complicated but that's why I want to do this.
Plus it can be very useful, but I don't have too many high hopes on getting
on the network because of the network administrators security concerns.

Thanks ahead of time for all the wonderful mail I am about to receive :-)

: packet radio? If so, what's the mail address syntax? Thanks.

I use the n0ary gate and BBS. Not only can you send email but you can
also participate in bulletins or any other BBS function. It is really
cool. Here is the whole file ... the author's address is at the end.

----------------(cut here)---------------

There is an error in the "73" magazine article. If you are an internet
only user the action of registering you automatically enables email

forwarding. You do not need to perform the "Enabling" step.

N0ARY/BBS Internet Gateway Operating Instructions
August 7, 1992

LOCAL USERS:

Local users are those that log into the bbs via the bbs's telephone modem port (408-749-1950) or via one of the 3 tnc ports (144.93, 223.62, 433.37). Each local user has a bbs account that is used to customize how the bbs interacts with the user.

Local users can set their account up so that all incoming mail addressed to their call will be forwarded via a gateway to internet and on to other networks (mcimail, compuserve, etc). All the user needs to do is enter his email address and turn the feature on.

```
EMAIL bob@hal.com
EMAIL ON
```

When the EMAIL feature is turned on the packet message will be deleted at the time of forwarding through the gateway. So care should be taken that the paths are correct prior to turning the feature on, for instance enable it, send a test message, and disable it. After a successful transfer re-enable the feature. To disable the auto forwarding feature simply type:

```
EMAIL OFF
```

Messages can be sent by packet users to the internet users via the gateway. This applies to users at N0ARY as well as users at other bbs's. Begin by sending a message to IPGATE@N0ARY with the first line of the message being the letters "To:" followed by the internet address of the recipient.

```
N6ZFJ de N0ARY >
  sp ipgate@n0ary
Enter your subject:
  Meeting?
Enter your message body:
  To: bob@hal.com
  Are you planning to attend the club meeting on Thursday? Give me
  a call. 73, Connie
  ^Z
```

NOTE: That the recipient cannot respond to the message unless they are a ham and registered with the gateway. He/she becomes registered by sending a message from his internet host to gateway-request@arasmith.com.

REMOTE USERS:

Remote users are those that do not log into N0ARY directly but merely appear from the packet world to use it as home. If a packet user checks

the "White Pages" for a remote user the entry comes back as @N0ARY.
The packet user then address his message to YOURCALL@N0ARY and the
bbs will do the translation and forwarding to internet.

It is not necessary for a person to know your actual internet address
nor use the SP IPGATE method described above. From the packet network
it appears that you are just another user at N0ARY.

WHITE PAGES:

The "White Pages" is a distributed database of all the bbs users. Most
bbs users in the US are represented in the database as well as many from
other countries. When a user chooses a home bbs, that bbs generates
an update that is sent to the regional servers and then distributed to
all the other bbs's. An entry consists of; call, home bbs, first name,
zip, city and state. When a user wishes to send another packet user
a message he/she consults the white pages (WP) for the home bbs.

REGISTERING:

Before a user, both local and remote, can send a message from internet
into the bbs system he/she must register with the gateway. This is done
by sending a message from the host that he/she intends to use to
gateway-request@arasmith.com with the following information:

  CALL:
  FIRST NAME:
  CITY & ST:
  ZIP:

When a request is received the "From" field is copied directly into
a file with the requesters call. Whenever the gateway receives a message
bound for packet it scans this file comparing on the "From" field. When a
match is found the gateway uses the associated call from then on. If
there is no match the mailer bounces the message with a one-liner
indicating the the user must register.

If you currently use another bbs as home this needs to be stated
in the request. Otherwise you will be assigned N0ARY as your home.
If you choose not to use N0ARY as your home you must make sure
people know to send your message to YOURCALL@N0ARY to pass through
the gate. Your WP entry will be wrong.

EXECUTING BBS COMMANDS REMOTELY:

Many of the commands available to local users is also available to
remote users by sending a message to the bbs. Here is a subset of
the commands currently available.

  LIST   listing messages

```
  LOOKUP        look up calls in the on-line callbook
  WHO call      dump a users account information
  READ          read messages and files
  USERS n       display the last n users to connect to the bbs
  INFO          display manual pages of various topics
  CD            change directories in the file system
  LS/DIR        display the contents of a directory
  WP call       look a user up in the "White Pages"
  HELP          get help on how to use a command
```

Not all commands available to local users can be accessed via the gate. All interactive commands are disabled as well as commands that modify the users account.

The command parser for the bbs is very powerful and the user can form very complex requests. For instance the following command is valid on the bbs:

```
  LIST LAST 20 BULLETINS FROM N0ARY
  LIST ALL BULLETINS ABOUT KENWOOD
```

The ABOUT keyword is used to search the subjects of messages for a given pattern, in this case KENWOOD. It can appear anywhere in the subject line.

This is an example of how complex all the commands can become. They can also be abbreviated down to the level understood my most other bbs programs. Any of the following will give the same results.

```
  L< N6ZFJ
  LIST FROM N6ZFJ
  LIS < N6ZFJ
  L FR N6ZFJ
```

In most cases a minimum number of unique characters is needed to distinguish a command.

You can get a list of commands and a translation chart from W0RLI to N0ARY by typing the following commands.

```
  INFO COMMANDS
  INFO W0RLI
```

Other commands that you may wish to execute are:

```
  INFO MANUAL
  HELP HELP
  HELP LIST
```

Now that you know what some of the commands are this is how you go about executing them. You send a message to cmd@bbs.arasmith.com with your commands entered one per line or separated by semicolons.

For example if you want to know if three of your buddies are in
the white pages and if the bbs has any messages about the ICOM W2A.

Send to:
  cmd@bbs.arasmith.com

  Subject: you can put anything here
  wp n0ary n6zfj n6une
  list all about w2a
  .

The bbs will execute the commands and respond to you via return mail.

SENDING MAIL TO PACKET:

Once registered the user is free to begin using the gateway to send
messages from his host through the gateway into the packet world.
How much you have to specify of a users address depends on how much
the bbs already knows about the user.

If the bbs knows the home bbs of the user and his home bbs is know to
the the N0ARY bbs, which most of them are, you simply need to supply
the call.

  n6zjf@bbs.arasmith.com

If the N0ARY bbs doesn't know of the user but does know where his
home bbs is then you need to supply just the home bbs call in
addition to the users.

  n6zjf%n6qmy@bbs.arasmith.com

Notice that the call and home bbs are separated by a percent sign '%'
rather then the '@' which is used in the packet domain. This is because
the '@' has a meaning in the internet address.

If the bbs has no knowledge of either the user or his home bbs then
you probably have the wrong home bbs or it is a new bbs. In which
case you will have to supply the full address so the bbs will know
how to route the message.

  n6zfj%n6qmy.#nocal.ca.usa.na@bbs.arasmith.com

This level of addressing is hardly ever needed and normally means that
the home bbs is in error.

Bulletins can be sent in a similar fashion. The address is made up
of a keyword, which can be any six character word and a distribution.
Distributions are local to an area. For instance SBAY is valid in
northern CA, it probably has no meaning at all in Topeka, KS.

Valid distributions are:

```
    ALLUS           please avoid this one
    ALLUSW             all western US
    ALLCA              all California, any 2 letter state should work
```

So if you trying to find a cw filter for a Kenwood TS440.

Send to:
  want%allca@bbs.arasmith.com

  Subject: Kenwood TS440, CW filter
  If you have one of these you are willing to part with please
  give me a call or leave message, thanks.
  73, N6ZFJ@N0ARY.#NOCAL.CA.USA.NA
  .

Be descriptive, brief, and always include your full return address in the message. Also please try to limit your distributions to small regions. Using the ALLUS distribution really slows down the flow of messages.

INFO ON THE N0ARY BBS:

The bbs came into being in July of 1990 and as of July of 1992 had over 600 users, 500 registered as home. The bbs has 3 rf ports, 2 phone ports, the internet port, and a voice synthesizer port. The latter allows users to check for messages via DTMF from their handhelds.

The bbs itself runs on a Sun workstation under Unix. The code was written by Bob Arasmith to focus on the user. Great care was taken to make the bbs very forgiving to the novice user but very flexible and powerful for the old-timer. The bbs can be configured to interact with each user differently. Some examples are:

 * List messages in either descending or ascending order.

 * Specify a list of keywords that the user wishes not to see displayed when a list is performed, similar to a kill file.

 * .signature and .vacation files.

 * Specify how many lines the users terminal is capable of displaying before scrolling, the bbs will feed info this many lines and pause allowing the user to catch up and continue or abort the operation. Similar to more.

 * Users can put commonly executed commands in keystroke macros that are accessible via a single keystroke.

A manual is currently available describing the commands and their permutations. This manual will be available in late 1992 as a postscript file. Run the command INFO MANUAL to learn how to get one via the post office. It is not available in an ascii format.

If you have any questions about the internet gateway or the bbs
in general please drop me a message.

73, bob
     n0ary@n0ary.#nocal.ca.usa.na

Here's what I know about cheap packet systems:

Summary of Inexpensive 2m Packet Systems:

---

1. For PC-compatibles:

   A. Poor Man's Packet: (the authors are on internet)
      I. Page 8 August 1991 73 magazine.
      II. Anonymous FTP: helios.tn.cornell.edu (128.84.241.2),
      /pub/PMP/pmp11dsk.zip (includes executables, source,
      article text, erratta, assembly notes, etc.).

   B. BayCom revision 1.50a software and either BAYPAC or use the
      TCM3105.ZIP Postscript schematic:
      I. Review: December 1991 issue of 73.
      II. Anonymous FTP: WSMR-SIMTEL20.ARMY.MIL (192.88.110.20) or
      mirror sites like OAK.Oakland.Edu (141.210.10.117)
      wuarchive.wustl.edu (128.252.135.4)
      ftp.uu.net (137.39.1.9)
      nic.funet.fi (128.214.6.100)
      src.doc.ic.ac.uk (146.169.3.7)
      archie.au (139.130.4.6).

      I have used wuarchive.wustl.edu (128.252.135.4):
      /mirrors/msdos/packet/tcm3105.zip and
      /mirrors/msdos/packet/baycom15.zip
      (=BayCom revision 1.50)

      The later revision 1.50a is available from ucsd.edu :
      /hamradio/packet/baycom/baycom15.zip (168789 bytes)
      and also an ENGLISH manual for rev 1.2:
      /hamradio/packet/baycom/manual.zip (42424 bytes)

      Note: Some older versions of the tcm3105.zip schematic
      have 2 R2s. I think the "R2" connected to the
      CTS line should be corrected to R3, a 2.2K ohm.

2. For Macintosh:
   PacketMac Modem:
   Page 8 October 1992 73, and errata page 54 November 1992 73.
   (the author's listed internet email (Francis4@apple.com) did
   not work, 2-24-93)

3. Commodore 64: I was told:
   > Digicom 64 in the August 1986 73 (date ??).
   >
   > The software is public domain and is usually bundled with a
   > "kit," PCB, hard-to-find parts, etc.; from some hams that
   > translated the original documentation from the German.
   >
   > A more-or-less accurate list of the guys that can supply the kit
   > is listed in the ARRL publication, "Gateway to Packet Radio."

Notes:
-----

1. I have only used Poor Man's Packet, but hope to try BayCom soon.

2. If you have Internet mail but not FTP, try the FTP mail server:
   send a mail message with the subject "help" and a single message
   line "help" to ftpmail@decwrl.dec.com.

3. You may require an 8-bit editor to modify the the Poor Man's
   Packet source code, I suggest Microsoft's m editor (came with my C
   compiler), or Microsoft Windows 3.1's Notepad editor.

4. I have seen these ads:

   BayPac BP-1, "$49.95 + shipping" (73, Jan 1993, p54):
       Tigertronics Inc
       400 Daily Lane
       P.O. Box 5210
       Grants Pass, OR 97527
       800-822-9722
       503-474-6700

   BayMod-9, "$65 + tax and shipping" (73, Oct 1992, p51):
       PacComm Packet Radio Systems, Inc
       4413 N. Hesperides St.
       Tampa, FL 33614-7618
       800-486-7388
       813-874-2980
       813-874-8696 FAX

   Digicom for Commodore 64 (Nuts + Volts, Feb 93, p11):
       Crawford Amateur Radio Society
       R.D. #1, Box 101
       Guys Mills, PA 16327
       $49 + $4 shipping
       Catalogue $1

5. I recently learned there is ALOT more available from:
    > For amateur radio related information, send a message to:
    >   ham-server@grafex.Cupertino.CA.US
    > Place only HELP and INDEX on separate lines in the text.

Please email me or post any additions/corrections.

Is there a way to give an amateur radio station the following capabilites:
(1) become an internet site
(2) be able to use ftp and telnet from that internet site (& of course email)

If so, would you please explain it to me? Thanks.

Announcing the creation of Spectrum, a new international communications and technology radio program. Spectrum will air Sundays Beginning June 13 at 0335 UTC via WWCR Nashville, Tn USA (7435 Khz) and the Let's Talk Radio Network (Spacenet3 Transponder 21, 5.8 Mhz Sub carrier Wide Band Audio). The program will feature produced segments on all aspects of communications from DC. through Light! In addition, there will be a live phone in segment with guests from the communications scene. The program will be hosted by Dave Marthouse, a long time radio enthusiast and professional broadcaster & Mark Emanuele a professional communications consultant. Spectrum will be underwritten by Holmdel, NJ based Overleaf International, a Data Processing and Telecommunications Consulting Firm. Spectrum will originate from studios at Overleaf's Holmdel, NJ Corporate HQ.

The kick-off program on the 13'th will feature a live call-in show. All of the Spectrum producers will be on hand to answer listeners questions via an 800 number. This number will be able to be used throughout North America. International callers will be able to take part via standart iddd calling. We can't provide international 800 access at this time.

Anyone with questions, comments, etc can send them to the following e-mail addresses.

Hello,

Has anyone been able to connect a Baycom modem and a TNC to a PC
running nos ?

I have attempted to do this, but without any success - if anyone
has any suggestions I would be grateful.

I am running the Baycom modem with the ax25 driver that allows the
Baycom modem to be used with the ftp packet driver interface. It
will work fine on its own, but when I try to attach the TNC2 as a
second interface, I can only get one of the two interfaces to
actually send and receive data.

The TNC2 works fine on its own as well, its only when I mix the two that
the problem occurs - most confusing !!!!

TAPR has a state machine DCD mod with will work with the PK-232. There is
also a PK232 Modem Disconnect kit, which is designed for adding an external
modem, but also has the necessary connection for the state machine, which
makes it very easy to install.

>--

You'll have to sort your mail address out first .. you have two in your
posts's heading,

From: sjg@phlim.ph.kcl.ac.uk (Simon Gornall)
and
X-Posted-From: phlem.ph.kcl.ac.uk

Both of these produce an error report from ben.uknet.ac.uk of the form :

Your message was not delivered to   sjg@phlem.ph.kcl.ac.uk
        for the following reason:
        Unknown Address
        Blue book transfer to kcl.ac.uk failed (permanent error code):
        "Got a QR(21)
Unknown username sjg at site UK.AC.KCL.CC.OAK,
        mail was not delivered."

The FAQ was posted recently with an expiry date of 6/26/93, so it should
really be still on the spool at your site. If not, there's the following
help in the FAQ itself (I'd rather not repost it all):

The Packet Radio FAQ's will be posted on a monthly basis to
rec.radio.amateur.packet. The current version of this document is

available via anonymous FTP at ftp.cs.buffalo.edu.

Many FAQ's, including this one, are available on the archive site
rtfm.mit.edu in the directory pub/usenet/news.answers. The name under
which a FAQ is archived appears in the Archive-Name: line at the top
of the article. This FAQ is archived as radio/packet-faq.

There is also a mail server on rtfm.mit.edu, which can be addressed as
mail-server@rtfm.mit.edu. For details on how to operate this server,
send a message to that address with the word "help" in the BODY of the
message.

A good reference with which to begin is "The ARRL HANDBOOK for
Radio Amateurs 1993",  American Radio Relay League, Newington CT.
1992.  LLC 41-3345.

See chapter 32, pages 43 to 56.  Use of Gunnplexers for a 10.5 GHz
link is described with possible application for a 2 megabit/s data
link.  Also, you might want to contact a company called Advanced
Receiver Research, Burlington CT, (203) 582-9409, which specializes
in Gunnplexer equipment.

Be sure to determine if you need to obtain a license to operate in
the band of interest.

If you get the the point where you start to undertake the project,
be sure that you know the Gunnplexers that you are purchasing.
Many of the inexpensive units are continuous wave output on a fixed
frequency without the necessary varactor modulating diode.

Hello

I am intersted in getting a tcpip packet station setup. I want to know
if I can get the software on the net with instructions that will tell
me what all I need to do to complete the job.

Thanks & 73's

>telephone lines coming into you full duplex modem do you?

Well, not exactly. V.32 modems use the same frequency carrier in
both directions, but employ adaptive echo cancellation to avoid
reception of their own outbound carriers.

And also not exactly for RF either. At microwave freqnecies, E and H
planes' polarization orientation is easily controlled. We often use
use microwave links that have two outbound channels on the same

carrier frequency, one carrier with veritcal polarizaion, the other with horizontal polarization.

By its nature, a Gunnplexer is a full duplex device. The local carrier oscillator is used for injection for the local oscillator. By offsetting the two ends of the link by 70 MHz, you'll obtain a 70 MHz FM IF output from the Gunnplexer's detector. You can run this into an off-the-shelf 70 MHz IF system for demodulation. For penny pinching amateur projects, you can offset the two link ends by about 100 MHz, then use a plain Jane everyday FM radio for your demodulator. If you really want to get fancy, you can lock your Gunnplexer modulation system to the receiver's AFC voltage for full loop control.

There is a nice Amateur allocation at 10.0 - 10.5 GHz, and commercially available 10.55 GHz Gunnplexers are easily tuned to this range by simple adjustment of a tuning slug screw. The amateur allocation is available to all but Novice license holders. You can operate there by taking two relatively easy multiple choice examinations (in the US). The amateur service is limited to strictly non commercial applications and operators must not operate in broadcast mode, transmit music, or transmit profane material, etc.

My intent of this question is exactly as stated. Can I use one
dish/horn as a transmitter AND a receiver at the same time
simultaneously. The reason I ask is because we have a couple
horns here that are either a transmitter or a receiver. The
diode in the center of the horn does only one job.

>> 6. Has this been done before with personal/amateur setup?
>

Not what I had in mind. I was thinking of a more affordable
setup. From the sound of your reply you really have no clue as
to what I intend to do.

>> 8. What security considerations are necessary? I will probably want
>>   to encrypt/scramble so eavesdroppers can't get system passwords etc.

>interested in eavsdropping on any of your conversations.

I take this as your good sense of humor. A data encryption chip
that would be considered useful would be one that is programmed
so that the method of encryption will varry with each user.
It's analogous to a combination lock or key lock with programmable
tumblers.

>Are you typical of the student body at Florida Institute of Technology?
>Take you school project else where. We don't do your homework for you in
>this news group.
>

This is not "homework". This is a project that I have initiated
and can be more accurately characterized as "research".

If you are using a "connected" machine:

You need to add the lines:

```
        domain addserver [132.239.1.1] ucsd.edu
        route add default eth0 mirrorshades.ucsd.edu
             #assume eth0 is your ethernet port
        route add [44.xx.xx/24] ax0 (your local tcp/ip AX.25 router address)
             #assume ax0 is your TNC port
             #assume 44.xx.xx/24 is your local subnet--
             #like mine is 44.76.2/24 for San Antonio
```

to your autoexec.nos file.

ucsd.edu is the authoritative DNS for all of ampr.org and mirrorshades is
the "super-router" for ampr.org--- you will be able to get to any
"connected" ampr.org subnet using this set up.

If you are not connected, you must build a file called domain.txt in your
\nos subdirectory that is of the form:

```
w6aaa.ampr.org  IN      A       44.xxx.yyy.001
w6aab.ampr.org  IN      A       44.xxx.yyy.002
etc. etc.
```

for all members of your local subnet. Note that if you are connected, this
file will be created and grow but for some reason does not delete "expired"
entries.... You ought to keep a basic file around to use as a fresh start
every time you reboot. (I used to do this in the startup batch file...)

There are lotsa good DOC files on UCSD.EDU for anonymous download on
how-to-do NOS setup.... (/hamradio/packet/tcpip/docs and in specific
versions subdirs as well)

Good luck!

```

Tony..

FAQ's, executables, docs, and lotsa goodies are posted for anonymous ftp
access at ucsd.edu.  look in /hamradio/packet/tcpip this collection is very
large and covers most all platforms out there today

Where can I ftp the latest TheNet? I think there is a 2.10
but I don't realy know for sure..

I know x1i is out but I can't it...

I have checked ucsd.edu for both but I can't find it... thanks!

OK, Steve, I'll give it a try....if it doesn't work, the guy from
TAPR left me some good info to get a state machine dcd mod for it.
First, I need to get the thing fixed.....my CON led stays on all the time.
I don't know why it does it...and it isn't 'that' much of an inconvenience..

Later.
John

There was an article in QEX, May issue? Maybe the esteemed QEX editor will jump
in here and give some info.

The voting period for the rec.radio.amateur reorganization has ended as of 2359 GMT, 9 June 1993 (7 PM US Central Daylight Savings Time). The results are as follows:

rec.radio.amateur reorganization results - 307 votes

Yes	No	2/3?	>100?	Pass?	Group
202	91	Yes	Yes	Yes	rec.radio.amateur.digital.misc
179	110	No	No	No	rec.radio.amateur.digital.tcp-ip
186	97	No	No	No	rec.radio.amateur.dx
196	93	Yes	Yes	Yes	rec.radio.amateur.antenna
197	97	Yes	Yes	Yes	rec.radio.amateur.equipment
172	106	No	No	No	rec.radio.amateur.instruction
175	108	No	No	No	rec.radio.amateur.operating
194	93	Yes	Yes	Yes	rec.radio.amateur.homebrew
204	88	Yes	Yes	Yes	rec.radio.amateur.space
175	105	No	No	No	rec.radio.amateur.emerg-services
142	125	No	No	No	rec.radio.amateur.rdf

--

In accordance with the Guidelines for Newsgroup Creation, the following groups will be created, barring any serious procedural objections, on or about Monday, 14 June 1993:

rec.radio.amateur.digital.misc
amateur packet radio, RTTY, AMTOR, Clover and other digital amateur radio modes (This replaces rec.radio.amateur.packet and adds other digital modes to the subject)

rec.radio.amateur.antenna
amateur radio antennas: theory, techniques and construction

rec.radio.amateur.equipment
amateur radio equipment: manufactured products and modifications

rec.radio.amateur.homebrew
amateur radio construction & experimentation

rec.radio.amateur.space
amateur radio in space: amateur radio satellites, earth-moon-earth (EME) communications, space shuttle, MIR space station, etc.

The existing rec.radio.amateur.packet newsgroup will be removed on or about Tuesday, 14 September 1993.

Here are the individual votes cast. The list is in case-insensitive order of the voter's email address, and lists the address, name, and votes cast (the 11 characters at the end of each line are in the same order as the results text above). The address and name are as parsed by Ron Dippold's UseVote software,

version 1.0. An attempt was made to mail an acknowledgement to each voter, with his vote as parsed by UseVote, but inevitably some bounced. I did not upgrade to later versions of UseVote because I did not wish to have to re-validate the process during a running vote. I have all of the email messages on file for all of the votes cast; if you're really intersted in them, drop me email and I'll make arrangements for transferring them.

rec.radio.amateur reorganization Final Vote Ack

Hi,

I have set up a temporary tcp/ip station at Muir Elementary School
in Antioch California. The initial purpose of it was to allow the
students to mail a letter to the President via E-Mail. Thinking, I
though it might me neat for them to receive mail from around the
world. So, if you have a free moment, and feel inclined to do so,
please send a short note to:

room16@school.cncr1714.pacbell.com

This will be forwarded over Packet Radio 145.75 to the school.

The station will be taken down Friday, June 18th.
Thank You,
--

You can find X1H on ftp.demon.co.uk. There is an X1J undergoing beta-test
(fixing some of the X1H 'features') which will probably end up on there as

well when it is considered 'safe'. I haven't seen X1I mentioned at all so possibly it was skipped.

Dave

>Is there a way to give an amateur radio station the following capabilites:
>(1) become an internet site
>(2) be able to use ftp and telnet from that internet site (& of course email)

While technically feasable, there are some legal issues involved here.

The FCC regulations governing Amateur Radio (47 CFR Part 97) make certain communications illegal. It would be extremely difficult to screen all Internet traffic to ensure it doesn't violate the content regulations for Amateur Radio.

So, any Amateur Radio operator putting the Internet on-the-air over his/her station would be risking fine and/or imprisionment due to violation of FCC rules.

However, many people do operate mail gateways between the Internet and packet radio.

Is there any internet gateways that will send you copys of the bulletin
that reach the packet node/bbs?? I'd like to be able to read the bulletins
flowing through the area without purchasing a tnc and second radio.

Also, is there any real-time gateways that permit node hoping (ie wormhole)
that is accessable from internet?

I read it in the June issue of QEX (or was it the May issue?). At the end
of the article the author says that a program for packet is a possibility,
if there is sufficient interest and if he has the time.

Why not just go buy a used TNC? Good ones (PK-88, KPC-3, MFJ1270) can
often be found for $50-75. Writing a program for a SoundBlaster might be
an interesting exercise, but sure sounds like a lot of work.

My $0.02 worth.

Is there any TCP/IP node that I can access that has an ax.25 port

in the northern/central NJ area? I'd like to try to make some
connections back home. Thanks!

>
>1. Where is a good place to get cheap microwave components from?

I don't know offhand, but you can contact Christopher Killian of

Carrier Communications at (805) 945-5448. He sells new microwave gear
and also sells the odd piece of used gear. Chris mentioned the average
price for a used digital microwave link like you describe is $10k+; you
might be able to build a system out of surplus pieces for less. Chris
will also be able to tell you some of the suppliers of microwave gear,
which you can use to gain more information.

>2. What frequencies can be used for this microwave link? HAM?

For the 10-15 mile range, you would probably use 18 GHz. Lower frequencies
would exhibit increased range but allocations are harder to get.

>   Are there allocated frequencies for such experimentation and
>   do they require a license?

Commercial point-point links are described in the Code of Federal
Regulations (CFR) Volume 47, Part 94. The eligibility for these
links is described in Part 90. I would suggest you go to a library
and research CFR 47 regarding the commercial and experimental
licenses.

>3. If I want full duplex, do I need 2 antennas at each end or can
>   one serve as a bidirectional with 2 separate frequencies used?

One antenna should be fine.

>4. Can one antenna be used to transmit AND receive (related to question
>   3 and 5).

Yes.

>6. Has this been done before with personal/amateur setup?

Commercial users do this all the time.

Good luck!

Thanks Bill, this is some great stuff! Now we're getting somewhere.
How do you get two carriers out of one horn? Do you have 2 diodes,
one vertical and one horizontal? (ie. for polarization). Good
point about the polarity. In an experiment we had a receiver and
a transmitter at 10.5 Ghz. When the receiver was twisted 90 degrees
the signal meter went dead zero, even when face to face one meter
apart from the TX. Our horns were for educational use only.
No access to the circuit, just a meter on the receiver. Someone
also mentioned using a laser. I like that idea (ie. no license
and it's a do as you please situation). My only concern about
laser is the hazard of someone looking into it. For a laser to
go 5 miles or so it needs to be adequate in strength and a good
wind or storm could knock it down or point it to the ground causing
a hazard. But I wish not to digress from our microwave topic.

PS. Has anyone done any laser modulation? Time for another post.
I saw a great article in the "Electronics Now" magazine (when it
was "Radio Electronics". I am tempted but it's expensive and
the above hazars exists.

it was electron

Well, cellular phone is close to microwave (upper mhz range) and
those little antennas can transmit and receive simultaneously.

I also thought they had dish antennas that could trandmit and receive
(on separate frequencies or different planes of polarization).
and same for horns.

    You have a pk-232 so if you have the threshold knob on the front left
    side of the unit you can use open squelch without having to play with
    the audio. The threshold knob varies the decode threshold where as
    on the pk-88 the threshold is fixed and thats why I have to use the
    vol control to make it flicker the dcd. Too much audio will make it
    stay on and it won't be able to transmit.

Does anyone know of any nifty mods to go with the KPC-3 Kamtronic TNC. I
have been collecting all mods for radios and other devices... Making it
real neat and eventually placing out here on the net for everyone to get
a look at... I wouldn't know what a strictly TNC/WE-Fax could be mod'd

to do, but I am sure that someone has figured something out...

Microwave polarization is controlled by the geometry of the
wavegide aperature and the orientation of the element delivering
the energy to the structure. Fancy waveguide sections can be used
to duplex several different polarizations into a common horn.
Depending on reflector dish used, you can mount two spearate horns
at the prime focus. Apartment building Satellite Master TV Antenna
(SMATV) systems often mount two feed horns side-by-side so as to
enable reception of all 24 H and V trnasponders from a single
satellite; with a small 2.3-3.5 meter dish with a farily low focus
to diameter (F/D) ratio, the focus is loose enough you can get away
with it.

Note that there is also left-hand and right-hand circular
polarization. Amateur satellites often employ circular
polarizaiton as well as do Intelsat hemispheric coverage
international satellites. For receiving, one can install a
dielelctric plate at 45 degrees in a standard wavegide. I don't
know about generating a circular-polarized signal in a waveguide;
I've never had to do it. For HF antennas, you can do it with two
Yagis 90 degrees apart fed with a phasing harness; I'm sure there
is a similar method using waveguide sections.

MiniSport Laptop Hacker - Vol 13, 29 Apr 1993
Copyright(C) 1993 by Brian Mork.

>>> ADMIN
No, I'm not superstitious, but the number of this MLH edition did pass my mind. The last two weeks, my ZL-2 has been out of commission. Almost simultaneously, I received a letter from n7ftm (Bill) that his is having the same trouble. I've spent the last few nights tearing mine apart. Bad for me; good for you! I've got more specs on how the power supply works in the next edition of MLH.

In addition, I've been digesting volumes of documentation on Internet and Waffle, a BBS program meant to host users and process Internet E-mail and Usenet topical forums. I now have a node running on my own computer. See the new (and let's hope stable) address below.

Two people have sent me messages via USMail because something about the packet link wasn't getting messages through. Each edition, I try to confirm in the ADMIN section who all I've heard from. If I don't mention your callsign here, I didn't get your message. This round I've heard from N9ADS, N9LNQ, WA8WZX, W4NTG, W5SYT, N7FTM, KA9CAP.

>>> COM I/O ARCHITECTURE
Continuing from Volumes 7,8, and 10, there are only three more registers to cover.

Line Control Register (LCR) at address (BASE+3)

This register allows you to configure the format of the serial data leaving the UART and (simultaneously) the format expected by the UART. All bits of this register are read/write.

Bit 0&1: These two bits select how many data bits are transferred in each asynchronous character. 5,6,7, or 8 bits are selected with values of 00,01,10, or 11 respectively. For example, if you desire 7 data bits, set Bit0 to 0 and Bit1 to 1.

Bit 2: Set to 0 if you want one stop bit generated on outbound data and checked on inbound data. Setting to 1 chooses 1-1/2 stop bits with 5-bit data and two stop bits with 6,7, or 8-bit data.

Bit 3: Set to 1 to generate a parity bit. Set to 0 if you want no parity bit at all. If this is set to 0, the next bit has no effect.

Bit 4: Even Parity Select. When Bit3 is 1 and Bit4 is 0, an odd number of 1's is transmitted or checked in the data bits and parity bit. When Bit3 is a 1 and Bit4 is a 1, an even number of bits is transmitted or checked.

Bit 5: When set to 1, the function of Bit4 is reversed.

Bit 6: Set Break. When this bit is set to 1, the serial output is forced to the spacing state (same as data=0) and remains until changing this bit to a 0.

Bit 7: This is the Baud-Rate Divisor Latch Access Bit. This bit is set to 0 for normal operation allowing access of the transmitter and receiver buffers at BASE+0, and the Interrupt Enable Register at BASE+1. When set to 1, these same addresses access the Baud Rate Divisor.

Line Status Register (LSR) at address (BASE+5)

This register provides information about recent data transfer. All bits are not read/write.

Bit 0: Data Ready. The UART sets this bit to 1 whenever a complete incoming character is available in the receiver buffer. It is reset to 0 by writing a zero or by reading the receiver buffer. Bit1 through Bit4 are "errors" that produce a RLS interrupt (see IER and IIR descriptions).

Bit 1: Overrun. This bit is set to 1 whenever the receiver buffer was not read by the CPU before the next character was transferred into the receiver buffer (overwriting the lost character). This bit is reset to 0 whenever the CPU reads the LSR.

Bit 2: Parity Error. If this bit is 1, the received character did not have the correct even or odd parity as selected by the bits in the LCR. It resets to 0 whenever the CPU reads the LSR.

Bit 3: Framing Error. This bit is set to 1 whenever the stop bit following the last data bit (or parity, if selected) is detected in the spacing level. (A stop bit is suppose to be mark status.)

Bit 4: Break Received. This is set to 1 whenever the received data input is held in spacing status longer than a full word's time: the total of start bit, data bits, parity, and stop bits.

Bit 5: Transmitter register empty. This bit is 1 when the UART is ready to accept a new character for transmission. It actually switches to 1 when the previous character is moved from the transmitter holding register to the transmit shift register. It becomes 0 concurrently with the loading of the holding register by the CPU.

Bit 6: Transmitter shift register empty. This bit is 1 whenever the shift register is idle (nothing being transmitted). It becomes 0 when the shift register gets a character from the transmitter holding register.

Bit 7: Permanently 0

Baud Rate Divisor Latch at addresses (BASE, BASE+1)

These two registers set the bits per second rate transmitted by the UART. This is a 16-bit divisor for the clock fed into pin 16 of the 8250 UART, giving a frequency *sixteen* times the desired baud rate. Pin 16 is usually fed with a frequency of 1.8432 MHz.

The LSB (least significant byte) is written to (or read from) address BASE, and the MSB (most significant byte) is written/read from address BASE+1. This is true only when the Divisor Access Bit in the LCR is set to 1.

The following table can be used if a 1.8432 Mhz clock is used (table values are decimal):

	300	1200	2400	4800	9600	19200
MSB	1	0	0	0	0	0
LSB	128	96	48	24	12	6

Lastly, a request: Please look in any data book you have and try to identify the following three chips. Two of each are surface mounted on the bottom side of the ZL power supply switching regulator board. I need to find out how they're suppose to work to know if mine are working! A pinout and short description would be GREATLY appreciated!

This is for all of you packet wizards/programmer types out there... I am running a Unix based machine with a direct connect to the Internet via our host here at USF. I am running under linux locally, which is connected via ethernet to the rest of our network. I thought it would be great if I could get a TNC to act just like my dialups and allow logins via packet radio. The fact is, I don't have a clue as to how to do

this... Basically, what I want, is that when someone connects to my TNC,
they get a login prompt from Linux. From there, they log in and do all
the stuff one does under Unix, with the added benefit of true internet
connection. If anyone has an idea how to do this, please e-mail me at
the address below.

Thanks,

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:

- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
  rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
  speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered presentation in rec.radio.info (even with cross-posting, only one message, with a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:

```
/Newsgroups:.*[ ,]rec\.radio\.info/h:j
```

either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:

```
rec.radio.info:!s/:^
```

in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:

```
sequence
rec.radio.info
rec.radio.
```

at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

 -- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

          rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
          rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

 -- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

```
sub address radio-info
unsub address radio-info
```

where 'address' is your full mailing address. Send this request to

```
listserv@ucsd.edu
```

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

```
sub mymailbox@myhost.mydomain.mil radio-info
```
or
```
sub MEMEME01@DMBHST.bitnet radio-info
```

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:

- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
  saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

 -- I have a regular posting with timely information, is there a way to
    speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are
willing to take responsible people and provide them the means of posting the
articles directly from their site. We will try everything we can as we fully
realize that DX (distant signal) and astronomical data can be somewhat
transitory. We are also willing to allow regular posters of information the
same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for
news.answer. This requires co-operation and good will to be beneficial to
the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to
suggestions.

I thank the following individuals for their input into this article:
     rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
     rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
     Paul W. Schleck, KD3FU pschleck@unomaha.edu
     Ian Kluft, KD6EUI ikluft@uts.amdahl.com

Well, at 56kb the GRAPES modem *is* the radio, it's an RF modem, so all

you need is a transverter to kick it's 29 MHz input/output up to the
UHF band of your choice. The now out of production Microwave Modules
MMT432S is commonly used, but any transverter with similar specs will
do nicely.

Gary

Hi all,

I want to know some info about TCP/IP across AX.25. I want to use NET.EXE
by KA9Q. The problem is I don't know who assigns IP adresses in 44 net.
I think there is probably something like "Country Coordinator" and
"Central Coordinator" for this (or am I wrong?), but I'm not sure if
Czech Republic has someone responsible for this.

73, (very soon will be) OK1XPV

Petr Vyhnak

P.S.: I would prefer replies via E-mail to VYHNAK@CSPGUK11.BITNET, because
reading NetNews is very complicated from here. thanks.

: Is this my ftp or some thing else wrong?
: It's same in DOS's PKUNZIP too.

Kohjin,

  This is zipped with a newer version of ZIP. UNZIP for this is also in the directory. If you tried an older UNZIP, that may be your problem. I successfully used it to generate the files which are in the pcb/ directory in unzipped form. There is nothing inside of pcb.zip which isn't also there in unzipped form.

  File lengths look correct so I think everything transferred OK? Let me know if you still have the problem after trying the pkz204g.exe utility.

: Wish we could use Ethernet Card rather tahn PCLANA Card.

  If you use Ma/Comm or similar xcvrs with electronic tuning instead of the motion detector type I think you can make everything run at full Ethernet speed. You'll want to widen the IF a bit and also reduce the Q of the discriminator to make things work well. I've actually gotten 10 Mbps data (from a signal commercial generator) through the receiver as it is shown though.

I just wondered if anyone out there has used the 580T on packet, and if so,
how did they interface the radio to their TNC.

Dave,

There is a book "NOS Intro" by Ian Wade, G3NRW which is supposed to be an
excellent introduction to TCP/IP on amateur radio. He is the gentleman that wrote
NOSVIEW. I have not yet located a copy around Phoenix and am about to call the

ARRL, they supposedly carry it for $25.00.

Greetings. Does anyone know if itis possible to get a ROM for the G0BSX Mk 1 TNC
(i.e. the earlier design of G0BSX which is =not= a TNC-2 clone) to run KISS
mode ??
A friend has acquired one of these TNCs, and the standard software does vanilla
AX25 and Host Mode, but not KISS mode.

I own an AEA PK-900 and I'm having a bit of difficulty getting it to
interface with NOS. Getting into KISS is no problem and I am able
to switch on my TRACE and copy traffic on the frequency. However,
the PK-900 is not responding to transmit commands. NOS executes
a ping request, for example, but the PK-900 does nothing.

I've tried adding PARAM DTR 1 and PARAM RTS 1 to my AUTOEXEC.NOS
with little effect. Are there any PK-900 or PK-232 owners who can
offer some advice?

Thanks and 73...

Your machine is overkill ;-) ... but it wil do.

You will need to FTP login to ucsd.edu (anonymous) and change directory down to /hamradio/packet/tcpip. Since you are using messydos, I suggest you download the basic KA9Q executable (in ../KA9Q subdir) or the variant by WG7J (in that subdir). The go to ../docs and get intronos.zip.... that ought to get you started....

You need to contact your state ip address coordinator for a 44.xx.xx.xx address and with a little playing, you will be in bizness! Also if you can join mailing lists.. there are several amateur tcp/ip groups available.

I'm sure there are folks in your area that know about tcp/ip over ax.25....

Have Fun....

From what I have learned, packet is like a relay-net. Imagine a bunch of HAMs on different frequencies and each one is listening to another frequency. A HAM coming into the network could send a message to one HAM on the net. From there, that message can be relayed to anyone on the net.

Packet is a lot like this. It isn't like a BBS; it's more like a highly connected relay network. To log into the net, you have to use a TNC (terminal node controller). You can get one for an IBM PC clone or almost any other computer. These controllers hook onto your rig (note you can use almost any band--be careful that your in an allocated frequency) and control the PTT, mike, and speaker. Usually, the commercial TNCs will have instructions for use. (I have heard that PK-88 is pretty good. I made my own.)

Typical transactions on packet consist of connecting to a node (a relay station), connecting to a BBS (yes, there are BBSs out there), sending a message (according to ARRL specs), or posting a message in someone's mailbox. Anything that a computer can do, a packet system can do. What's nice about packet is that many HAMs may use a single relay station at the same time. This is possible because of the protocol packet uses. Each packet is self-contained. So the relay station can accept many disjoint packets. Part of the protocol (X25?) requires that packets may come out of order. The software puts the packets back in order.

Getting your system up is a challenge--especially trying to find the relay stations. If you want to know where to find the relay stations, contact a local club and get a list. ARRL also keeps track of repeaters and packet relay stations.

Hope this helps.

-Sean

According to AEA, the latest version is marked 23 Aug, 1991. I bought mine in
 April and it has a sticker with this date on the bottom.

Bill

>How fast are the High Speed packet modems operating...in a reliable
>connection? Are packet bbs forwarding lans operating at 56KB yet?

Well it depends on channel loading of course. We see transfer rates of
about 2 kilobytes/sec on a good half duplex channel with light loading.
We've been operating our inter-LAN trunk switching systems at 56kb for

several years now. Two of our BBS systems are directly connected to the
56kb trunks while the rest run at LAN speed on the LAN side of the
switches. We have both full duplex packet repeaters (voice style) and
regular simplex digi type LAN systems. These are co-located with, and
hosted on, the switch computers for the inter-LAN trunks.

>What kind of problems due to propagation on uhf have occured to these links?

Well the usual problems with inversions. All our switch sites are either
on mountaintops or atop skyscrapers or broadcast towers. They are basically
in line of sight (30-60 miles) with their neighbors. The only real problem
is with one BBS system that's down in a valley and sometimes is under the
inversion while the switch remains above the layer.

One of our major switch sites is currently experiencing intermittant
"deafness" that's been driving our tech people crazy. Of course it
is never deaf when they're at the site with test equipment. :-(
They've swapped out every piece of equipment with known good equipment
at least twice, so the opinion now is that it's some sort of intermittant
interference. It can hear a 100 watt signal, but not the usual 7 watt
signals when it's experiences these episodes of deafness.

This is one of the problems with these systems, unlike a voice repeater
experiencing interference, there's no way for users on the ground to
hear any interference and get a clue as to the problem. All they know
is that the switch is "down". This has led to frustration all around.

Gary

(relayed at the request of RW3DZ)

Dear educator colleagues!

The club station at School #1 in Troitsk, Russia has been active since 1964 (UW3KBA-UK3DBA-UZ3DXB). Since 1990 we've been working on a project called, "School E-mail Systems via PACSATs for Educational Purposes." The school station presently operates terrestrial packet VHF and we have organized a local network involving other schools. Our satellite link is still under development. Progress is slow, however, since we must build all of our equipment ourselves. For example, on VHF we use fixed-frequency rigs (144.625 MHz), a homebrew TNC-2 type controller and a CP/M type computer. We should have a PC for the station very soon.

One of our goals is to assist local schools to improve their technology curriculums--particularly in the area of telecommunications, space physics and languages. During the academic year 1992-93 we have a group of students age 12-15 working at the UZ3DXB station regularly as operators. We've recently established a VHF packet-radio link with Moscow, but no PBBSs exit there--yet. Our future plans include building additional rigs to work the various OSCAR satellites and the MIR space station. We are also considering the possibility of setting up our own packet PBBS here in Troitsk.

I am searching for educators who are involved with similar Amateur Radio activities in the US, Canada and Europe. In particular, I wish to contact teachers who would be interested in cooperating with us in an joint Amateur Radio educational venture using packet and/or satellites.

Each summer in Troitsk there is a conference for educators titled "Computers in Schools." This year it will take place June 24-26, 1993. This may be an excellent opportunity for us to meet. (We have a group of educators from California who participate in conference regularly.) I know this is terribly short notice, but if you are interested, please come.

If you cannot attend, I'd still be interested in hearing from you about the project idea I have described. Your comments and suggestions are most appreciated.

My email address is: zait@sovam.com

(an alternate address is: rw3dz@sch1tr.msk.su)

All the best and 73 !!!

[I forgot to post this to rec.radio.amateur.packet, of all places]

I spoke to Warren Stankiewicz of the ARRL regarding packet operation
at Field Day. He confirmed my belief that the "free" Packet station
may use repeaters, either digipeaters or net/rom, and that the Packet
station may operate on any band pursuant to the rest of the Field Day
rules (i.e. 15 minute rule, etc.).

However, Warren warned me about two things that may not be obvious
regarding packet operation for Field Day.

Warren said that packet contacts which use non-amateur means of
communication, specifically Internet, are not qualified for Field Day
points.

I asked Warren "What if you don't know that the Internet is being used?".
He said "If we find out, those points will be disqualified". I did not
specifically ask about wormholes such as the Simi Valley-CAPRA link,
but I assume these are the same, they are non-amateur landline networks,
which is what the term "Internet" generally describes.

My concern is that net/rom routes can be "opaque"; i.e., you may not
know what kind of technology is used to link the nodes, and may
inadvertantly make illegal Field Day QSOs. In fact, this significantly
reduces my enthusiasm to use digipeaters or net/rom during Field Day,
since virtually every contact there might be disqualified later. At the

same time, it gives me an incentive to protest Field Day groups showing large packet totals, given the likelihood of the use of non-amateur services. This is not meant as an anal-retentive comment, just a conservative reading of the rules.

Another issue is that packet contacts, whether by a conventional station or by the Packet-only station, count as CW QSOs. Therefore, if you operate HF in your packet station, you need to make sure to dupe CW QSOs by any station with packet QSOs by any station. I.e., if you have a 20m CW station and he works KK6JQ on CW, and your Packet station works KK6JQ on 20m packet, you only get to count one of the QSOs.

In summary:

* Packet QSOs may use digipeaters and net/rom, but must not use non-amateur services, regardless of whether you know or not.

* Packet QSOs dupe against CW QSOs.

If you have any questions or comments, please contact "contest@arrl.org" or Warren Stankiewicz of the ARRL at (203) 666-1541.

I build my own packet board, so I don't know if this will help. Typically, there are four signals: microphone, speaker, PTT, and ground. The ground is common in the 580, so use the speaker's (or tie the microphone-jack's to

the speaker's ground--that's what I did). The 2/32" submini stereo phone jack is nearly impossible to find, so I just used the mono version. Until recently, this would have been a problem, but many HTs have VOX-like circuitry which only transmits when voltage is sensed from the microphone line. The 580 pretty much uses the PTT to supply voltage (+5V) to the microphone. The way the microphone's jack is configured, inserting a mono phone jack will short the ground to the +5V. There is a 100 ohm resister on the +5V so that there won't be too big of a problem. However, this will drain your batteries rather quickly. I have thought of cutting the grounding band on the mono jack so that it won't short, but I haven't done it yet. Another idea might be to carefully paint a nonconducting resin over half the grounding ring. No, I haven't tried this either.

Anyway, I found that the 580 works fine with my Baycom. I just haven't had the time to do all the things I would like with it.

Also packet allows direct connect from "computer" to "computer" for keyboard ragchews.

There is an organization here in Colorado called COPA (COlorado Packet Assoc.) which helps promote the various aspects of packet.

MiniSport Laptop Hacker - Vol 8
28 Feb 93

>>> POOR MAN'S PACKET (PMP) ON THE MINISPORT.
Hallelujah! I got it working! I have a complete TNC built on a little perfboard. It slides in the left side of the MiniSport in place of the land-line modem Zenith sold with the computer. As soon as I finish the series on the COMx: ports, I'll cover how this information was used to make a complete packet station *inside* the MiniSport (minus a handheld).

>>> MINISPORT LAPTOP COM2 PINOUT
Take the cover off the modem slot on the left side of your MiniSport. If you have a modem in place, slide it out. Inside you'll see a 16-pin connector:

```
    1  3  5  7  9 11 13 15    (Viewed looking in the slot, right side up)
    2  4  6  8 10 12 14 16
```

The pins are as follows:

1. +5v output
2. +10v output
3. -10v output
4. GND
5. TTL signal (or power supply?). High when CMOS setup turns COM2 on. Alternately the command line MACHINE MODEM ON lets you set it to high; MACHINE MODEM OFF sets it to low.
6. Carrier Detect, TTL input.
7. Received Data, TTL input.
8. GND
9. Transmit Data, TTL output.
10. Associated with the built-in computer speaker. Touching to +5v through a 1kohm resister makes the speaker squawk.
11. ?? ground ??
12. Ring Indicator, TTL input.
13. Data Terminal Ready, TTL output.
14. Clear to Send, TTL input.

15 Request to Send, TTL output.
16 Data Set Ready, TTL input.

>>> COM I/O ARCHITECTURE

In Volume 7, the addresses of the COM I/O ports were given. Now I'll start discussing to what each of the nine registers actually allows access. I'll refer to a BASE address. In the case of COM1, this is 0x03F8. In the case of COM2, this is 0x02F8. I'll cover them in relative order of popularity.

Receiver Buffer Register and Transmitter Holding Register (BASE+0)

These two registers appear at the same address. The receive buffer is read only; the transmit buffer is write only (makes sense!). This is where you read the actual byte received over the COM port or where you write the data you want to send out over the COM port.

CAUTION: BASE+0 will access these registers if and only if the most significant bit of the LCR (BASE+3) is zero.

Modem Control Register (BASE+4)

This register allows you to control certain output wires from the 8250. Normally, you'll write to this address, but you can read the register back in if you want to find the state of certain bits.

Bit 0: This bit controls the Data Terminal Ready output. When set to a 1, DTR is "true." This corresponds to a low TTL level, normally inverted to become +12v at pin 4 of a DB-9 connector. PMP oscillates this line to control the mark/space output of the modem. When this bit is set to 0, PMP receives a high TTL level, providing a 1200Hz mark frequency.

Bit 1: This bit controls the Request to Send output. When set to a 1, RTS is "true." This corresponds to a low TTL level, normally inverted to become +12v at pin 7 of a DB-9 connector. PMP uses this as the PTT line output. PMP Key down is selected by writing a 0 to this bit.

Bit 2: This controls an OUT1 line, not normally used in the PC environment. The output is inverted like the above two. Setting the bit to 0 (zero) gives high TTL output.

Bit 3: This controls an OUT2 line, not normally used in the PC environment. The output is inverted like the above lines. Setting the bit to 0 (zero) gives high TTL output.

Bit 4: Provides a loopback feature. Set to 0 for normal operation.

Bit 5 - 7: Writing to these has no effect. Reading these bits will always provide 0 (zero).

Modem Status Register (BASE+6)

This register lets you check on the status of certain control lines received by your computer.

Bit 0 - 3: These are edge sensitive versions of the following four bits. Whenever any of the following four bits change state, the corresponding bit from this set goes to 1. Reading the MSR sets all four bits back to zero.

Bit 4: This Clear to Send (CTS) bit is 1 when a low TTL level is presented to the UART. This normally corresponds to a +12v received on pin 8 of the IBM/PC 9-pin connector. Used by PMP to monitor the mark/space status of the data stream coming in. An incoming space (2200Hz) will give a 1 when you read this bit.

Bit 5: Data Set Ready (DSR) is 1 when a low TTL is presented to the UART, corresponding to pin 6 of the DB-9 being held at +12v. PMP uses this as a Carrier Detect line. It expects a 0 when the modem is receiving either a mark or space tone.

Bit 6: Ring Indicator. Logic the same as above two, provided into pin 9 of the DB-9 by whatever is hooked to it.

Bit 7: Received Line Signal Detect. Logic is the same as above three, with no normal connection in the IBM/PC environment.

>>> UPCOMING
8250 DOCS, SERIAL & PARALLEL BUFFER CHIP PINOUTS, PMP SCHEMATIC, SHRINKING YOUR FAVORITE SOFTWARE, MINIMUM BOOT FILES, BOARD REVISIONS, and more DISASSEMBLY.

Thanks to W4NTG, N7SXD, KD7HP, and others who have given me feedback the last few weeks. I've been hot and heavy into getting TPK1.80 (automated mail drop on my local computer) up and running.

>>> ADMINISTRATIVE

My packet address remains the same, but notice that my Internet address has changed (it's now jupiter rather than visual). Does anybody have a recent callbook? Is my address correct in the 1993 Callbook? 6006-B Eaker, Fairchild, WA 99011 is the correct address. Send me packets, e-mail, or US Mail. I need ideas, questions, and answers!

The local sysops have frowned on sending back issues through the packet network. If you need some back issues, please send me a disk, postage & mailer to get it to you. In addition, I've got word back that a 7k packet message is too much. I will try to keep them to one page (but there's so much good stuff!). What format would you like them in? 80 columns is ok? 75 columns? Do you print at 6 lpi or 8 lpi?

>>> COMMUNICATION

I just came across an easy circuit that lets you wire up bidirectional transfers with a parallel port. I need to look at that one a little bit & talk about it in an upcoming issue. Has anybody else seen this done?

But for now, let me pass on some serial port information. Buried inside your ML is a more advanced chip that appears like an 8250 programmable UART. Eight consecutive addresses are taken by the chip for each communication channel. For those of you who are unfamiliar with this concept, let me repeat: Each "port" on your IBM/PC compatible really takes up eight consecutive addresses. All addresses are used by comm software. On the ML there are two blocks of eight addresses: COM1 and COM2. Following is a chart introducing the organization of these powerful I/O chips. For example, if you want to check on the CTS, DSR, and RI of COM1, you could read in the Modem Status Register at address 0x03FE (hexadecimal). Bits 4,5 and 6 would give you the condition of the desired lines.

DLAB	A2	A1	A0	8-bit Register Name
0	0	0	0	Rcvr buffer (RBR), or Txmtr buffer (THR)
0	0	0	1	Interrupt Enable (IER)
x	0	1	0	Interrupt Identification (read only) (IIR)
x	0	1	1	Line Control (LCR)
x	1	0	0	Modem Control (MCR)
x	1	0	1	Line Status (LSR)
x	1	1	0	Modem Status (MSR)
x	1	1	1	--- nothing ---
1	0	0	0	Baud Rate Divisor latch LSB (DLLS)
1	0	0	1	Baud Rate Divisor latch MSB (DLMS)

Note: A2-A0 are the three LSB of a IBM/PC "COM" port address, e.g., the MCR (offset of 4) for COM2 (02f8) is available on a IBM/PC platform at address 02fc). DLAB is the MSB of the LCR.

On any PC compatible, the following addresses are in effect:

Register	COM1	COM2
RBR & THR	03F8	02F8
IER	03F9	02F9
IIR	03FA	02FA
LCR	03FB	02FB
MCR	03FC	02FC
LSR	03FD	02FD
MSR	03FE	02FE
-		
DLLS	03F8	02F8
DLMS	03F9	02F9

End of my page. Continued next time...

>>> UPCOMING
MORE 8250 DOCS, SERIAL & PARALLEL BUFFER CHIP PINOUTS, COM2 PINOUT, Poor Man's Packet INSIDE YOUR MINISPORT, SHRINKING YOUR FAVORITE SOFTWARE, MINIMUM BOOT FILES, BOARD REVISIONS, and more DISASSEMBLY.

For about the last two weeks I've been listening for Mir without sucess.

Does anyone know the status of the amateur radio abord the space station?

Bob... I just forwarded you the list of Macintosh Ham Radio Software
listing... and it is being posted on the net here within moments.

Feel free to direct any questions about TCP/IP for the Mac to the
net... we'll give you some help.

I use a DJ100T which has the same jack as the DJ 580. I called Alinco and they
faxed me
 a schematic of a suggested packet hookup. The submini stereo plug is available
from
You Do It (YDI) Electronics in Needham MA (617-449-1005).I don't use the
batteries when
hooked up to packet , I use an external power supply (ex CB radio type).
Hope this helps
Pete

I have a Novice license and would like to get started
in packet cheap. I have an old IBM PC, but am interested
in getting other Novices in my family started as well.
Can someone give me a rundown of approximate costs of
TNC's and radios that can be used? I'm assuming that
there's ftp-able Free/ShareWare available for use.

If you intend to vote on the rec.radio.amateur reorg but didn't get around
to it when the 1st and 2nd Calls for Votes (CFV) were posted, there is very
little time left.

VOTING ENDS TUESDAY, JUNE 9, 1993 AT 23:59 UTC.

If you have an opinion (in favor or opposed) on the newsgroups proposed for
creation, you can make your opinion count by voting.

If you do not have a copy of either of the CFVs, send an e-mail to
   cfv-request@uts.amdahl.com
and an auto-reply program will send you a copy of the 2nd CFV, as posted by
the moderator of news.announce.newgroups. It will include instructions on
how to send your vote to the vote-taker, Jay Maynard K5ZC.

Hi folks! I'm about to be sent to Germany for a few years.
I was DA2KO last time I was over there, but I wasn't on
PACKET then. I would like some info on VHF PACKET in
Germany, in particular in the Wuerzburg area and on 2M.
Things like frequencies, what types of networks exist
such as netrom or?
Thanks and 73

Good morning. It's Sunday the 6th of June and here is the GB2RS news
broadcast, prepared by the Radio Society of Great Britain.

And we start with a special 'good morning' to all taking part in the RSGB
National Field Day Contest.

First the headlines:- Look out for GB5SAW and GB2SEG this week; there's
another Microwave Round Table this month; and bookings for the AMSAT-UK
Colloquium are due in by the end of the month.

The callsign GB5SAW will be aired by the South-East Essex Sixth Form College
from tomorrow, Monday the 7th until Friday the 11th, under the guidance of
George, G1VCY. The idea is to introduce the students to the fascination of
amateur radio. Operation will be on 2 metre and 70 centimetre, SSB, FM and
Packet between 10am and 4pm. If you hear them, why not call in? If you are
unable to call during the operating periods, then send a packet message to
GB5SAW @ GB7DUG. Last years event was an unqualified success and an even
better response is hoped for this year.

News now of an expedition by the Scottish Expedition Group to Buchan Ness, the
most easterly point on the Scottish mainland. The callsign GB2SEG will be
aired from next Friday the 11th through to Sunday the 13th. The WAB square is
NK14 and the locator is IO97CL. For further information contact George, GM2TW
on 0324 715624.

All listeners to this broadcast, whether RSGB members or not, are invited to

the RSGB Headquarters Open Day on Saturday the 19th of June. This is a chance to tour the Society's administrative Headquarters, visit the GB3RS shack and see the QSL Bureau, Library and Museum. Doors are open between 10.30 am and 4.30 pm. Staff and volunteers will be on hand to answer queries, and the book shop will be open all day. A map of how to get there can be found in the June edition of Radio Communication, or call Belinda Gannon on 0707 659015 for details.

There will be another RSGB Microwave Round Table meeting on Sunday the 20th of June. Organised by the RSGB Southern Microwave Group, the event will be at the Crawley Amateur Radio Club premises at Pease Pottage, near Crawley, West Sussex, and it will commence at 10am. The attractions include: Technical talks, power and noise figure measurements, travelling wave tube demonstration and the usual round table discussions. There will also be a bring and buy stand. Hot drinks and snacks will be available. For further details telephone Mike, G3LYP on 0494 881298.

The Annual AMSAT-UK Colloquium takes place from the 29th of July to the 2nd of August. Full details of this major event for those interested in satellites can be obtained by writing to AMSAT-UK, 94 Herongate Road, Wanstead Park, London E12 5EQ. Completed booking forms for those attending and needing accommodation should be returned to AMSAT-UK, by the 1st of July.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From the Bahamas, N4JQQ will sign C6AFP from the Island of Great Abaco, from tomorrow, Monday the 7th for one week. Main activity will be on 6 metres, but some WARC band and CW operation is also likely. From Svalbard, LA6MY is signing JW6MY from now until September, using CW only. From Ile Verte, a French group will use the callsign TM5IV from Friday the 11th, until Monday the 14th of June.

Rally news now and we know of one Rally for today, Sunday, the 6th of June:

The 25th Spalding Mobile Rally is being held at the Springfield Gardens, Spalding. Doors open at 10.00am. There are trade stands, a flea market and radio boot sales. All trade stands and the flea market will be under cover in the new Exhibition Halls. Morse testing will be available on demand and refreshments will be on hand. The entrance fee includes entry to Springfield Gardens.

We know of two rallies for Sunday the 13th of June:

Elvaston Castle National Radio Rally is to be held at the Elvaston Castle Country Park, near Derby. The Show ground is located five miles South East of Derby on the B5010 road and is well signposted. There will be over 150 trade stands, together with all the usual attractions including the grand bring and buy marquee. There is also a flea market which will open at 9am and a craft marquee. Children's entertainments will take place through the day, also there will be live band performances during the day. Refreshment will be available. Talk-in will be on 2 metre and 70 centimetres via GB2ECR. Further details from John, G4PZY on 0332 767994.

The Royal Naval Amateur Radio Society Annual Mobile Rally is to be held at the

Sports Field, HMS Collingwood, Fareham, Hants. Doors open at 10.00am. The event features dozens of trade stands of interest to radio amateurs and computer enthusiasts. Also children's amusements and other attractions for all the family. Refreshments will be available. Talk-in will be on 2 metre and 70 centimetres. Details from Cliff, G4UJR on 0703 557469.

And we have news of three other events later this summer:

The organisers of the Longleat Amateur Radio Rally are apparently suffering from an incorrect rumour concerning entrance prices. It is quite untrue that it will cost over ten pounds a head, the entrance will be a modest increase on last year at 2.50 for adults, 2.00 for pensioners and 50 pence for children.

The Scarborough Amateur Radio Society regrets that due to circumstances beyond its control, the Radio and Electronics and Computer Rally planned for the 25th of July has had to be cancelled. However, the club is pleased to announce that next year's Rally will be held on the 29th of August 1994, Bank Holiday Monday, at the Spa on Scarborough Sea front. For further information contact Ross, G4ZNZ on 0723 514767.

A new event is the East Yorkshire Radio Rally which will be held at the Beverley Racecourse on Sunday the 25th of July. There will be trade stands, special interest groups, plus a bring and buy stall. Traders or others interested should contact Peter, G4EJP on 0964 550397 evening or 0964 550921 during working hours.

HF contest news now:

The RSGB's HF National Field Day is taking place this weekend, finishing today, the 6th at 1500GMT. An article celebrating 60 years of NFD can be found in June's RadCom. The All Asian CW Contest runs from 0000 on Saturday the 19th to 2400 on Sunday the 20th. All bands from 160 to 10 Metres will be used, but excluding the WARC bands. Contest exchange is RST and two figures indicating age, ladies to send 00. The Spanish URE RTTY Contest is scheduled to start on Saturday the 19th June at 1600 and runs for 24 hours. Use 45.5 bauds and 170Hz shift. See June RadCom page 16 for information.

Now some VHF contest news:

The RSGB 50MHz Trophy Single and Multi-Operator Contest takes place next Sunday the 13th of June from 0900 to 1700GMT. The RSGB 432MHz FM Fixed and Open Contest is on Saturday the 19th of June from 1800 to 2200GMT. Also the RSGB 70MHz CW Contest is on Sunday the 20th of June from 0800 to 1100GMT. Please note, this event does not take place on the 7th as printed in February's RadCom. Details for all three are to be found in February RadCom on page 66.

And now the solar factual data

The period 24th to 30th May has seen a reasonable increase in solar activity, with some quiet geomagnetic levels giving improved HF band conditions. Sporadic E has been reported on both 10 and 6 metres. Three small M type

flares were reported, the largest being an M1.4/SF on the 28th. Sunspot counts climbed from 34 on the 24th up to 130 by the 29th giving a mean of 95 for the period. Solar flux levels have also increased reaching 140 units on the 30th, with the period averaging 117 units. The geomagnetic Ap indices were very quiet at first, being down to only 1 on the 25th, but rose to the very unsettled level of 21 units by the 27th, together with a considerable decline in HF band conditions. The period averaged 9.2 units. The state has been 'nil nothing to report' throughout the period. The data on radio quality indices are not all to hand due to the holiday. For the period 24th to 27th May levels increased well above normal up to very good, with the Tokyo and Fort Collins Boulder circuits being up to excellent. With the increase of geomagnetic levels on the 27th, the radio quality indices fell to well below normal. The daily average aa indices, as supplied by the British Geological Survey for the period 18th to 24th May, were down to quiet levels of only 11.4 nanoTeslas, K2, with the 24th being very quiet at only 5.8 nanoTeslas, K1. The X-ray flux has risen considerably reaching B4.9 on the 27th and averaging B3.7 for the period.

Now the ionospheric data for Central France:

This week, due to the holiday, not all the data is to hand. The F2 daytime critical frequencies at Poitiers as reported by Meudon for the 24th to the 27th of May rose to quite high levels, reaching 9.4MHz on the 26th and averaging 8.7MHz for the period. The darkness hour lows have not changed much and averaged 4.9MHz.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg for the 23rd to 27th May averaged 7.6MHz and the lows 5.8MHz.

And now the solar forecast:

This week, one of the quieter parts of the sun will be looking our way. Solar flux levels are expected to be about the 110s. Based on the radio quality indices, the HF bands should be around normal but the passage of an old but rather large coronal hole may give some magnetic disturbance later in the week. The Lyrids meteor shower is expected from the 4th to the 12th June. And finally, Nikola Tesla's dream has come true. A series of far reaching experiments in the Space Power Systems project has now shown that very large amounts of usable power can be transmitted at microwaves, using Wireless Power Transmission Technology. In one test 30 kilowatts was passed using a frequency of 2.45GHz which was converted to DC with an efficiency of 82%. Recently an aircraft used for communication purposes was controlled, and kept at the high altitude of 70,000 feet indefinitely, powered by microwaves. Tesla was rather ahead of his time in 1912 when he tried to do it on Long Island.

And that is the end of the propagation information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 Tango Tango and G7 Oscar Whiskey series, and Novice calls in the 2 0 Alpha Foxtrot and 2 1 Bravo X-ray series.

You're listening to GB2RS, the news broadcasting service of the Radio Society
of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

>This may not be appropriate for this group but...

>I FTP'd a copy of ka9q and have been laboring over the docs. The "Packet
>radio" interface has me very curious. Can anybody point me to a place to
>look for more information on this very different networking system? Books
>or FTP-able documentation would be good. Thanks to anyone who has any
>pointers.

You need a Ham Radio license for that. Check out rec.radio.amateur.packet
for info on packet radio and rec.radio.amateur.misc for info on licensing.
Also see any Ham Radio supply store. Some bookstores also carry info on
Amateur Radio. If you know any Hams, they can probably also be very helpful
with this question.

The no-code Technician licence (i.e. no Morse Code) is the class of license
you would want to study for in order to get packet radio privileges.

[NOTE: since this may change some of the info above, if the UseNet vote in
progress passes, rec.radio.amateur.packet will be split into
rec.radio.amateur.digital.misc and rec.radio.amateur.digital.tcp-ip. Results
will be available some time after June 9.]

HAM-server has been swamped with orders for XPCOM131.

Happy to help out, radio pals, but there is a 4-meg daily limit to the
files that I can send out. Therefore, it may take two or three days
before y'all get your order filled, as it's first in, first out.

John S. Kennedy KB8GYS asked the following questions:

>Quite a while ago when I first started Internetting someone told me
that there were "live" Internet/Packet gateways from the Internet side
where licensed amateurs could get an account on the system and then
telnet into a packet BBS, perhaps on the other side of the planet, and
call CQ on the 2m side or whatever the freq is on the other end.

>Anyone know the telnet addresses of these systems?

You can telnet to to the Clarkson University (in Northern NY state) node using the following command: "Telnet 128.153.16.172" The node will ask you for a LOGON and PASSWORD. Off hand I don't knot how you would get this. I got mine by logging onto the node through a normal Packet connection. That way the SYSOP knew, or had a good idea that I had an amateur radio license.

Can you get to NY city direct on Packet? If you can get there I can give you directions to Clarkson.

Hi all,

I have been trying to register for using the n0ary gateway by sending
mail to the gateway-request@arasmith.com and got an error message of
"host unknown - valid name, but missing A or MX record". I know what
this error means, but don't know why arasmith.com doesn't have a proper
entries in the tables.. Has anyone else been having the same problems
when sending to arasmith.com?[

Thanks for your help..
Please reply via email.

Thanks..

Bernie nu1s

Lines: 20

  Some files pertaining to the "Inexpensive Multi-megabaud Microwave
Data Link" first shown in Ham Radio magazine and now also in the ARRL
Handbook are available by anonymous ftp on col.hp.com under packet/n6gn.
There is an associated README file.

  Artwork made available by Jon Bloom, ke3z, after work by John Conner,
wd0fhg, is there in postscipt and HPGL forms. This artwork appears
sufficient to build simple boards for both the transceiver (RF) and
receiver boards. I personally built up one set from an earlier revision
which worked after some minor modifications. I believe, but am not
certain, that some of these modifications have been included in the

available artwork.
  I do have schematics but presently I have no board designs for a
TTL <=> ECL interface for these radios which currently have a pinout and
ECL interface similar to an Ethernet media access unit. If interested
in this you may email for details to glenne@sr.hp.com.

Can somebody tell me what the proper cabling between the KPC-3 and the FT-530? If the one is the KPC-3 manual is the correct one, where would I look for cabling errors? Pluging in the mic cable keys the radio up right away.

Looking at the FT-530 manual, it gives a slightly different circuit for hooking things up....

I built the cable for the TNC before consulting the FT-530, because I wanted to just monitor Packet activity with my scanner first....which is what I'm still doing.

Another question I have is where can I find the 4-mm coaxial power connector for the Yaesu FT-530? I tried a connector with the right center opening, but the outer diameter is too big (5.x mm). And, the next size down that I could find has an OD of 3.4mm...and the ID is too small for the radio.

Does anybody know off hand if a 12V-1Amp brick is enough juice to drive the FT-530?

tomcat.gsfc.nasa.gov is basically off the air while W3IWI is on
assignment.

Tom W3IWI has temporary moved to Sweden. He said he would shutdown
tomcat when he went. Tomcat isn't, at least for now.

You can log on from the Internet side using any password. You will
not be granted ports access until you have sent a message to the
sysop (k2cc) and asked for it. Hopefully, it doesn't take too long
to get access, I just applied.

Greetings
Does anyone know of a TNC/radio combo that can be used with a Palmtop or Notebook? I am looking for a lightweight mobile pac-radio node that can be used in the field. Ideally, a PCMCIA TNC+radio would be best. Spread-spectrum solutions are not available to us in Manila, and cellular rates are not exactly affordable, so it seems that the only available technology that would allow mobile nodes (w/notebooks or palmtops) to communicate with each other (or a central office) would be via packet. The only problem is, is there a lightwieght TNC/radio combo around?

thanks all, and kindly email your responses to system@prs.ph.

Subject: ICOM W2A <=> KPC3 help
Newsgroups: rec.radio.amateur.packet
Lines: 25

I am trying to interface an ICOM W2A with a Kantronics KPC3. The KPC3
manual suggests using a 3.9K ohm resister between pin 3 of the KPC3
DB-9 connector and the "ring" of the W2A connector.

This resistor is used for current limiting while allowing enough current
to trigger the W2A's curcuitry to transmit.

ICOM suggests using between 20K and 30K ohms to do this. I also assume that
there is some internal resistance in the KPC3 but surely it can't account
for the difference between 3.9K and 20K-30K.

If you have done this, I would appreciate any information that you have

regarding the values that you have used and any comments/suggestions.

Please respond directly to my ID...

What I would like to see eventually is an Internet<>Packet Gateway
operating at higher UHF/microwave frequencies so that 9600bps would be
useful to do some FTPing. This is ANOTHER Amateur Radio Misconception:

"When you get your ticket you can connect to the Internet and do all
kinds of stuff like FTP, telnet, etc..."

Misconception #2: You need KA9Q to use Internet.

Not.

Scott-

One thing about "direct replies", is that one can't tell if anyone else has
responded! Therefore, I am also posting to the newsgroup.

I just came across YAPP (version 2), and remembered seeing your request.
When I first saw it, I looked around at several sites, and was disappointed
that it wasn't easy to find. I finally came across yapp.arc, at
HAMSTER.business.uwo.ca (129.100.22.100), in the directory /hamster/ham.

Yapp is my favorite packet program. However, I understand the author
doesn't intend to upgrade it any further.

2ND CALL FOR VOTES
AND VOTE ACK
REC.RADIO.AMATEUR REORGANIZATION

This is the 2nd official Call for Votes for the reorganization of the
rec.radio.amateur hierarchy of newsgroups. The first CFV was posted May 10th.
This vote is being conducted according to the official newsgroup creation
procedures, which are posted regularly in news.groups.

Votes may be cast only with the simple fill-in-the-blanks form which appears
in the "HOW TO CAST YOUR VOTE" section later in this CFV.

An acknowledgement for votes received ("vote ack") is included near the end
of this article.

SUBJECT OF VOTE

All of the newsgroups proposed below are UNMODERATED.

rec.radio.amateur.digital.misc
  amateur packet radio, RTTY, AMTOR, Clover and other digital amateur
  radio modes (This replaces rec.radio.amateur.packet and adds other
  digital modes to the subject)

rec.radio.amateur.digital.tcp-ip

TCP/IP via amateur packet radio

rec.radio.amateur.dx
DX (long distance) amateur radio communications

rec.radio.amateur.antenna
amateur radio antennas: theory, techniques and construction

rec.radio.amateur.equipment
amateur radio equipment: manufactured products and modifications

rec.radio.amateur.instruction
amateur radio instruction & examination

rec.radio.amateur.operating
amateur radio operating procedures and techniques

rec.radio.amateur.homebrew
amateur radio construction & experimentation

rec.radio.amateur.space
amateur radio in space: amateur radio satellites, earth-moon-earth (EME) communications, space shuttle, MIR space station, etc.

rec.radio.amateur.emerg-services
emergency services: RACES, ARES, NTS, and other use of amateur radio in emergencies or disasters

rec.radio.amateur.rdf
radio direction finding: recreational hunts and searches for interference

Two existing newsgroups will not be affected by this vote. They are rec.radio.amateur.misc and rec.radio.amateur.policy. They do not appear on the voting form and no changes resulting from this procedure will apply to them. rec.radio.amateur.digital.misc will replace rec.radio.amateur.packet if it passes, otherwise rec.radio.amateur.packet will remain unchanged.

DURATION OF VOTE

Voting commenced when the 1st official CFV was posted on 10 May 1993. It will continue until 9 June 1993 at 23:59PM UTC.

Voting procedures are detailed in the next section, "HOW TO CAST YOUR VOTE."

Upon completion of the voting period, the results will be posted to news.announce.newgroups, news.groups, rec.radio.info and all the current rec.radio.amateur.* newsgroups. In order to pass, newsgroups must have at least a 2/3 majority of YES votes and at least 100 more YES than NO votes.

HOW TO CAST YOUR VOTE

Jay Maynard, K5ZC, is serving as vote-taker for this vote. Please REPLY to this message via MAIL to his account, jmaynard@oac.hsc.uth.tmc.edu; using your newsreader's "mail a reply" command on this message should work. Posted votes can not be counted. You will receive a reply within a few days after your votes are received which indicates how the vote counting software thinks you voted - please mail corrections immediately.

PLEASE USE THE FORM AS IT IS. The vote-taker requests that voters cut out the rest of the CFV besides the form from their replies so the saved votes won't take so much storage.

Please do not delete anything between the "-=-=-=-=-" lines - and most certainly do not modify the group names. Votes will be tallied by an automatic program and if it can't determine your vote you will be asked to re-vote.

For each group that you wish to vote on, simply add your vote in the appropriate space on the same line. Recognized votes are Yes, No, For, and Against. Yes and For are equivalent, as are No and Against. Capitalization is not important. If you want to abstain from voting on a particular group, just leave the space blank. Don't worry about spacing of the columns or any quote characters ">" that your reply inserts.

You may _NOT_ do a combined vote - i.e., "I vote for all of them" or "I vote against all of them." Please use the form.

You may only vote once, regardless of how many accounts you may have. Forwarded or proxy votes are invalid.

Reminder - don't delete anything between the lines below. But please remove the rest of the CFV from your reply.

REFERENCES

For more information on the newsgroup creation procedures, refer to the article "Guidelines for UseNet Newsgroup Creation" in news.groups, news.announce.newgroups and news.answers. It includes the requirements behind the rules in this CFV including, for example, voting by mail only, the allowed length of the voting period, required margins to pass, prohibition against proxy, forwarded, or conditional votes, etc.

For a complete transcript of the decision-making process that led up to the Request for Discussion and Call for Votes for the rec.radio.amateur reorganization, anonymous FTP to charon.amdahl.com and obtain the files called
   /pub/radio/amateur/news.groups-discussion.Z
   /pub/radio/amateur/rra-reorg.log.*.Z
The newsgroups on this CFV were the result of the 30-day discussion period that followed the Request for Discussion (which was posted March 25, 1993.)

The rra-reorg mail list was the forum for developing the RFD and for turning the results of the discussion on news.groups into this CFV. The mail list was advertised several times on the rec.radio.amateur.* newsgroups. The following people chose to join and assisted in putting together the proposal:

   ben@nj8j.atl.ga.us (Ben Coleman NJ8J)
   brian@nucleus.amd.com (Brian McMinn N5PSS)

Yes they are.

It lets us see what is going on in the US.

thanks. bernd. I definitely didn't expect a reply from Deutschland, of all
places. The problem I am trying to resolve is in Manila, where phone lines
are impossible come by, and for a good number of of people, the only way to
communicate is by sending each other messages on their pagers. Do you know
if either TNC will work with packet-radio BBS software like BB (by Roy
Engehausen)?

Hmmm. If you left the TNC/Radio/Psion combo on, how long before the batteries
run out?

Thanks again for the info,
Joel Disini

Does anybody have the address and telephone number for a Kantronics
Dealer - preferably in the Philadelphia area.

Thanks......
Richard

You might try sending any traffic to bbs.arasmith.com... I have been
using Bob's system as a gateway fro quite a while now, just ask any
Ham that reads RAIL@ALLUS... that's one way that the info gets put
up there, seeing as how I forward stuff (in short bursts) to a friend
that puts it out.......

He's N6LVI,
I'm Brad - NP4AI

cheers!

I have an older copy of this THS software that came with a DRSI TNC that
I bought, I was wondering, What is the most recent version, How/Where to
get it. Thanks.

I recently posted a sale listing on this board. I received
a note from the sysop of hudlink that I should be ashamed
of myself for this action, since the users of this boards will
be shocked and horrified. If I have caused any such emotions
please allow me to say that I am sorry. I see similar sale
listings on rec.aquaria, which I read fairly regularly, and
assumed that they were allowed on all boards. If ANYBODY
was as upset as the sysop assumes, please let me know. IF I
don't hear from anybody, I am going to tell the sysoAL that
he is off base on this one.

Hi all,

I have a PK-88 TNC running at 1200 baud with an Alinco DJ-580T ht.
I would like to purchase a dedicated data radio for packet. I don't want
to fool with 1200 anymore so I need a radio for 440 that will work at
9600 baud. By the way, I forgot to mention that I was going to buy a TAPR
9600 baud modem kit. Is this a good idea?

I will entertain "for sale" offers of used equipment.

On a related note, what kind of equipment is required to go 56Kbaud??? This is where I would like to be someday!

dave

Lines: 54

I'm looking for information on how to decode an FSK signal that is being transmitted in the VHF band. From what little information I do have, it says the signal is an "FSK signal with a data rate of 8,000 bits per second".

The Motorola MC3356 "Wideband FSK Receiver" appears to be exactly what I'm looking for, except that the "test circuits" and "sample applications" in the data sheet are for a signal at 100 MHz. Being _FAR_ from an RF engineer, I have no idea what things need to be changed in the circuit to operate it at a different frequency. The things that "bother" me in the schematics are descriptions of coils like:

L1 - 110.7 MHz, 0.4uH, 7T #22 3/16 form w/ slug & can
L2 - 10.7 MHz, 1.5uH, 20T #30 3/16 form w/ slug & can

My guess is that these are winding figures for the coils: 7 turns of 22 gauge wire with a 3/16" inside diameter? I'm not sure what "slug & can" means, though. I asuume the inductance (?) is dependent on these

windings. [In other words, can I call up DigiKey and order a 1.5uH coil and would it be "seven turns of 22 gauge at 3/16"?]

L2 appears to be for the intermediate frequency (10.7 MHz is standard and fine for my application.) But assuming the signal I'm interested in is at, say, 144 MHz, it looks like my L1 needs to be 154.7 MHz. (Although I've seen examples where you SUBTRACT the IF... I'm so confused! :-) What I'm looking for is a way to determine what size & type of coil you need for a specific frequency. Is there a formula or something?

Finally, how about doing the opposite? (Modulating an FSK signal instead of demodulating it.) I assume that a low power FM transmitter IC (Motorola makes some for use in cordless phones, etc.) could be used to transmit the signals from a function generator set up to work as an FSK oscillator. Again, though, what is the proper way to select the correct transformers, coils, etc. for the proper transmitter frequency?

These questions may be too broad or not worded very well, but I'm hoping there's an example of an VHF FSK modulator/demodulator circuit somewhere out there which also explains how to tune it for a specific frequency.

I'll be happy to answer any questions I can via e-mail. If you have the data sheet on the MC3356, it will probably help explain what I'm asking about. :-)

Thanks for any help.

Regards,
Ed

I have a Kam kpc3, and also a kam allmode. I very seldom use the kpc3.

Recently, my kam died and I was forced to use the kpc3 until I figure out
what was wrong with the kam (4066 had died).

I am using version 6 in the kam all-mode, version 2.8 in the kpc3. Wow!
what a difference!

Are there newer roms for the kpc3? Are they downloadable/ftp?

HAs anyone rcvd xpcom131 and decoded it yet? I rcvd it in 12 parts and raN
uudecode then that made a .zip which I unzipped (PHEW !) Now the
unzipped files contained a few that failed the crc check and that was
after running pkzipfix.

Cutting to the chase....does anyone have this available via anonymous FTP?

KNews/Mac is developped by JK7GPC (Hiroki Kanehira).
JK7GPC (Hiroki Kanehira) has the copyright.
This English(?) document was written by JF1LZQ (Yutaka Sakurai), and my Email address is jf1lzq@morpheus.prug.or.jp.

<Known bugs>
1.Error will be occured when you read the mail which amounts over 32KB.
2.Ocasionaly, you meet "Alert" when you try to delete the news which has been read.
3.You can not re-distribute the news to the downstream. You will have to be the end.

<How to use this software>
1. Put the KNews/Mac into the folder where the NET/Mac exists.
2. Make a new folder there and name it news.
3. Double-click the KNews/Mac.
4. Select mail or news.
5. Select the "Set up" menu from Edit in the menu-bar, when the 1st time to use KNews/Mac.
    (1) Set "user" your user-name.
    (2) Set "host" your host-name.
    (3) Set "Rnews host" your neighbor station.

<How to get the KNews/Mac>
KNews/Mac is free-to-distribute.
PRUG(prug.or.jp) will be IP-reachable within a few months, but not yet.
Now, the only Email is available.
So, please give me a Email if you help us to put this software to the anonymous FTP site.

I've had my account on N0ARY for only a few days, but from test messages it
seems to work very well. It's much easier to use than the other systems
sound like they would be. From the Internet side, it has the feel I'm
accustomed to from using mail and mailing lists.

>I find that assuming a ham is a good apple until he proves me wrong is the

Thank you for running this service, Bob. I haven't had a license for long,
but I've been amazed by the number of people who freely give of their time,
money, and expertise to other hams.

How are the rules in Australia different? Would you not be responsible for
messages going through your packet station, or are the rules for usage of
amateur radio less strict?

I've been trying to send a message to the k2cc internet->Packet Gateway.
The NOS Mailbox throws all messages to k2cc or k2cc@k2cc into the bit bucket
Is there an internet address to get to the sysop of that system?
Also there is another system at Cal Tech (la). does anybody know how to contact
them? (I live 2 hours north of there).

Thanks Tom

What is need is a better/faster connection to/from the Internet via
packet. 9600bps would be nice. Then we could actually do something on
the service/get something useful from it like FTP large files for free.

I just received a copy of a book called "The Whole Internet" by Ed Krol.
My birthday's a month a way so this is my present.

Would anyone be able to tell me how to find out who my local tcp/ip
packet coordinator is? Geographically, I m in Maryland, and I'm trying
to obtain an ip address.
Thank you.

I had a slight problem here, radio pals. I have lost all file requests
placed to HAM-server within the last 24 hours. If you have made a
request in that time frame and do not receive anything within the next
24 hours, please resubmit.

Sorry 'bout that.

This file has been moved to

/hamradio/packet/software

See the INDEX or HELP files for information on ordering.

Efforts are under way to upload to the ftp sites. Look for it there.

All you might ever want to know about the KA6ETB HAM-server

Hardware:
========

386/25 PC clone
Telebit QBlazer modem
20-Meg file space reserverd for archive

Software:
========

Waffle 1.65
WFSmail 2.03

General Information:
==================

Orders for files are filled between the hours of 0200-0400 daily. This is so those hosts through which the traffic is forwarded are not overloaded. Since we all depend on the generosity of others to carry the mail, it behooves us not to make them angry.

ASCII (text) files are split at about 30,000 bytes or 700 lines (which ever comes first). UUENCODED binary files are split at about 750 lines.

If you are using a PC and you do not have UUDECODE, follow these steps:

1. Order UUDECODE.BAS or UUDECODE.C, and UUEXE515.ZIP.
2. Compile UUDECODE.BAS or UUDECODE.C on your system.
3. Use the resulting executable to UUDECODE UUEXE515.ZIP. UUEXE515 has documentation about UUENCODE/UUDECODE.

You are all set to start ordering binary files from HAM-server.

/hamradio/newfiles/ contains files that have not yet been categorized. You can order a list of newfiles by sending the following in an email.

```
NEWFILES <date>
```

<date> is in the form of MM-DD-YY, and is required.

If you order a file and do not get it, check the index to be sure you have spelled the filename correctly. If you have ordered the file correctly, then order a new INDEX, as I may have moved the file to a different directory. The system is still expanding, and I am trying to keep it in managable chunks.

Also, if you have ordered files from HAM-server and do not receive them, it might be because your return path is incorrect. My bounce mailbox fills up quite regularly with bounce messages. And, since the path is incorrect, I cannot contact you to let you know.

Orders must be sent to HAM-server. Orders sent to KA6ETB or HAMSinfo are ignored.

A new INDEX is automatically generated every Sunday and when files are moved or added.

Message Command Language:
==========

There are some general rules for ordering files:

- Commands and operands are not case sensitive.
- Leading spaces are permitted before the command. Commands must be the first token on a line.
- A '#' character as the first character on a line is treated as a comment. The line does not cause an error.
- A line beginning with the string "--" is treated as end of input. The remainder of the message is ignored.

The commands are:

```
GET
HELP
INDEX
NEWFILES
PING
QUIT
```

The GET Command:

The GET command sends the requested file. The syntax for the GET command is:

```
GET <filespec> [uue[ncode] | xxe[ncode]]
```

<filespec> is required. <filespec> must specify a path, but without a drive specification. The filespec is not relative to any directory.

uuencode or xxencode is optional and may be abreviated as "uue" or "xxe", respectively. If neither are specified, the file is sent according to the file extension. Files with these extensions will be sent encoded:

```
com exe zip pak arc arj gif lzh lha zoo z tar
```

If uuencode is specified, the file is sent uuencoded.

If xxencode is specified, the file is sent xxencoded.

For example:

```
GET /hamradio/00-index.txt
GET /hamradio/utility/uuexe515.zip uue
```

are syntactically correct.

The HELP Command:

The HELP command gets this file.

The INDEX Command:

The INDEX command sends an index of files available from HAM-SERVER.

Use

```
GET 00-INDEX.TXT
```

to get a description of the files.

The NEWFILES Command:

The NEWFILES command sends a list of files newer that the user specified date.

The systax for the NEWFILES command is:

     NEWFILES <date>

<date> is required. <date> has the form of mm-dd-yy. HAM-SERVER is
strict about checking the form of <date>; if it does not look like
it expects, the command will be rejected.

A valid specification for the NEWFILES command is:

     NEWFILES 02-15-92

The PING Command:

The PING command causes HAM-SERVER make a simple reply, via the
session transcript, to the requestor. To test the path to HAM-SERVER,
send the PING command.

The QUIT Command:

The word "quit" as the first token on a line causes HAM-SERVER to
quit processing input as if end of input had occurred.

Index of files.

NOTES: ----------

If you order a file and do not get it, check the index to be sure you have spelled the filename correctly. If you have ordered the file correctly, then order a new INDEX, as I may have moved the file to a different directory. The system is still expanding, and I am trying to keep it in managable chunks.

Also, if you have ordered files from HAM-server and do not receive them, it might be because your return path is incorrect. My bounce mailbox fills up quite regularly with bounce messages. And, since the path is incorrect, I cannot contact you to let you know.

Orders must be sent to HAM-server. Orders sent to KA6ETB or HAMSinfo are ignored.

A new INDEX is automatically generated every Sunday and when files are moved or added.

/hamradio/newfiles/ contains files that have not yet been categorized. You can order a list of newfiles by sending the following in an email.

        NEWFILES <date>

<date> is in the form of MM-DD-YY, and is required.

The archives may contain the same file under different names. If you should run across one of these, please let me know with email to KA6ETB@GRAFex.Cupertino.CA.US

Comments on the above posts:
```

9600 baud packet exists. Some of the 1200 baud radios can be
modified so that they don't clobber the PSK data too badly.

Recommendation on TCP/IP, best I've seen: "TCP/IP Network
Administration" by Craig Hunt, O'Reilly & Assoc.

A reasonably current list of AMPR IP coordinators is available from the
Supplemental Archives at ftp.cs.buffalo.edu under file /pub/ham-radio/
ampr_coordinators.

Thanks go to Brian Kantor for continuing to track this information.

Immediately after reading your message I went to EEB in Vienna Virginia
and purchased a KPC-3 and that evening interfaced it to my IC-W2A using
the 3.9K resistor as suggested in the KPC-3 documents. It works wonderfuly
well. Enjoy yourself.

>Please respond directly to my ID...

I tried your id, but it defered to your ego....

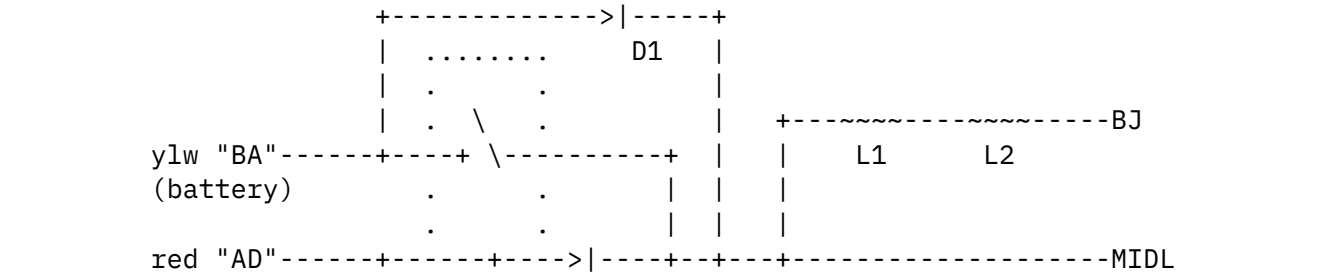
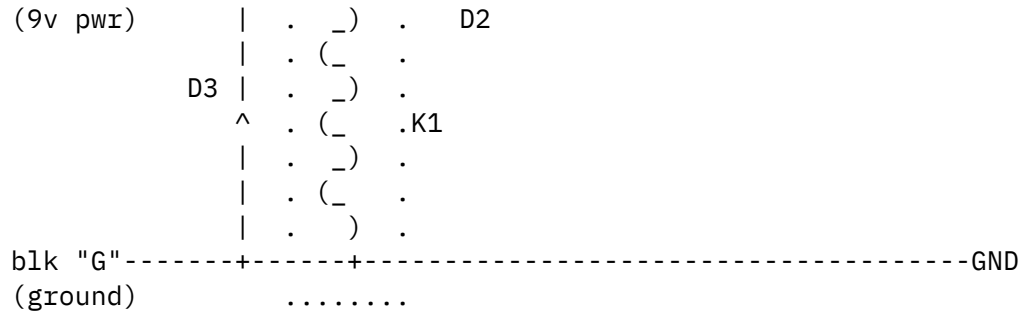
MiniSport Laptop Hacker - Vol 14   25 May 1993

Copyright (c) 1993 Brian Mork

>>> ADMIN
Things have been pretty quiet this time around. I got only one message back from the field. In the meantime, I managed to bring up an Internet node in-house, and I'll start porting these newsletters over there, too. Look in the micro.zenith and rec.radio.amateur.packet forums. If you read these MiniSport Laptop Hacker newsletters, please make it a practice of kicking back at least a one line message indicating what parts are particularly useful or not useful.



>>> POWER SUPPLY HARDWARE
Well, for those of you that have been following the MLH series, you'll know that one of my power supplies has been giving trouble. It finally gave up the ghost. Simultaneously I heard from another ham who had nearly identical symptoms: The Power & NumLock LEDs flash on for about 1/2 second and then the computer power downs by itself. From Internet, I heard from one person who bought his for a real price, with a guarantee. Its power supply died this way, also, and the seller replaced it. He's had no problems since. Too many similar stories! I wanted to know what's going on! In the meantime, I'm looking to buy broken MiniSports.



I tore mine open and started from the exterior working in. There are a handful of components that condition power and select where power is coming from --the AC adapter or the battery. This initial power supply section is documented below.

My two ZL-x computers are different:

Older	Newer
* Power supply piggyback card with number PA2020P25	* Power supply all on one card with number PA2020P65
* Motherboard 1PC1606AMB-40I with green patch wire from TP43	* Motherboard 1PC1606AMB-41I, no patchwire from/to Test Point 43.
* U47 BIOS is "BIOS V3.3D"	* U47 BIOS is "444-804"
* Disk controller WD37C65BJM has manufacture date in 22nd week of 1989.	* Disk controller is same part number dated 44nd week in 1989.

The power conditioning sections are physically different, but electrically they're the same. I expect my older one was a "fix-it" prototype that later made it onto the production board. Here's the schematic of the piggyback section:

```
 D1,D2 - two B8300s or integral N9K-60QC04        BJ named because the
 D3    - ceramic bubble (part no. unknown)        older power supply has
 L1    - approx 24 turns on 1/4" form             a Blue Jumper wire.
 L2    - 1 turn on core
 K1    - SPDT DIP relay, bottom    M    AD n/c    MIDL named because it
                          view     *    *  *      is the MIDDLE wire
                         pinout:   |              connecting the piggy-
                                   *    *  *      back board.
                                       GND BA
```

Operating from battery power, power comes in through D1 and out both the BJ and MIDL connections. When the 9v is available, current comes in through D2, again going out BJ and MIDL. My suspicion is that one of these carries the main power current and one is a monitor tap, i.e., indicates when AC sourced power (9v) is available. Additionally, K1 pulls the contact closed, providing current back to the battery pack for charging. If you listen carefully when 9v is connected, you can hear K1 click closed. the glass diode (D2) provides a shorted path for the current spike coming from K1 when it clicks off.

Notice that this circuit is in operation whether or not the computer is turned "on." It might be more appropriate to think of the computer as always being on; when you press the on button, the power supply just "upgrades" to full output status. The rest of the power supply (all stuff between what I presented above and the header I described back in issue ????) lives on an approximately 5"x4" circuit board. Reverse engineering of this board has been slowed by my inability to identify three chips. There are two of each of the following: MB3778 (16-pin IC), K612 (3-terminal + heat sink tab), and D4049G (16-pin IC). PLEASE FORWARD ANY INFORMATION YOU HAVE ON THESE THREE CHIPS.

In article <C7r7zL.Iuo@vcd.hp.com> I wrote:
>The Motorola MC3356 "Wideband FSK Receiver" appears to be exactly
>what I'm looking for, except that the "test circuits" and "sample
>applications" in the data sheet are for an FSK signal transmitted
>at 100 MHz.

To explain a little better, the MC3356 has a Colpitts type oscillator which connects to an internal mixer (to mix the oscillator with the RF input). Pin 2 is the "OSC Emitter", pin 3 is the "OSC Collector". In the test circuit (set to operate at 100 MHz), Motorola shows the following components:

What frequency does this combination of two capacitors and an inductor oscillate at? (I assume 110.7 MHz, which is 100 MHz + the 10.7 MHz IF?)

Now the $25,000 question: How do I choose the appropriate component values to operate the oscillator at a DIFFERENT frequency?

I can't seem to get the "resonant frequency" calculation to come out right for the example. [f = 1 / 2*Pi*SqRt(L*C)] What am I missing?

Any help would be greatly appreciated!

Thanks and regards,
Ed

Hello:

I take care of a local area packet network in Vancouver
B.C. which consists of a hub BBS and three slave BBS's
serving some 400 users. The whole system uses FBB 5.15.

The problem we are having here is that due to number
of external realities we're getting precious few
bulletins of general interest up here. That is, the
ALLUS* and WW stuff is being edited, censored, sent to
the bit bucket before it gets to us. Efforts to find where
the blockage is have essentially failed.

What I am wondering is if there are any other FBB sysops
on the internet who could export their allus* and ww stuff
to a file, zip it, and send it to me via the internet,
perhaps twice a week.

Now I basically know squat about the internet, so if all this
sounds dumb, that's the reason. I don't know if there would be
charges involved, or what. If there were, I would, of course,
pick them up.

My sense of things is that it would be cheaper to do this
via the internet rather than a direct long distance call

to download an export file from Winnepeg as I have been doing.

Any suggestions would be appreciated.

Recently I posted a message regarding: what is the latest kpc3 rom version?

My mistake, I meant to say kpc2.   Big difference! Anyways, is there an updated version of the rom floating around for this?

I have 2.84 in the kpc2, Version 6 in my kam.

I have a modem and ftp if it is available from somewhere. I got Kam 6 off the finish site, but I have not seen a kpc2 rom anywhere.

Remember when I complained that Pasternack Enterprises wants $10/each for
BNC jack-to-plug straight feedthru adapters... with a $100 minimum order?

After about 15 minutes on the phone, I have found that ITT and Amphenol
do make the things, but because there is a low demand for them, both
companies have reseller pricing about about $40 *each* in quantity 1-10.

Pasternack doesn't look so bad then. If there is enough interest in a
quantity order from Pasternack for these things, I might be willing
to organize it, but since it only cost me about $28 to send my radio to
Standard to get the jack replaced, I will probably just find a way to
get by with two $3 barrels connected together.

Yesterday I found a copy of the Graphic Packet Terminal Program for
use with the Baycom type modem. If anyone out there is using the
Baycom program you might want to give this one a try. It has a

very nice GUI which is much easier to look at and use.

But, on to my problem and question. Graphic Packet, like Baycom, was written in Germany therefore all of the documentation and config files are in German. The program itself has an option to display in English or German so actual interface use is not a problem.

My question is: If anyone out there is using this program (I'm sure people are -- again it's very nice) can you provide me with some insite about features you have been able to find and use.

For example: In the configuration file there are many parameters that can be set or changed. Some of these are obvious while others are not. Does anyone know what these are and do.

Another example: The program has a special BBS interface mode for The Box, F6FBB, and a couple of others. How do these work?

Any hints, tips, etc. would be appreciated. For anyone that is interested in looking at this program the only place I could find it on the NET was at NIC.FUNET.FI in the pub/ham/packet/terminal directory as gp123.zip.

To all that answered, *thanks*. as is usual, life delivers an interesting twist on the story after I posted my original message. read on...

In <1993May4.144040.15122@ke4zv.uucp>, Gary Coffman writes:
>A FAX modem switch could be a better alternative, a good one is
>available from Sam's Club. Your phone won't ring unless it's a voice
>call.

Thanks, I'll look but so far I've been dissapointed in those boxes
because they usually require some form of interaction after the phone
picks up. my modem and dialer are *real stupid* and I don't feel
like writing yet another dialer...

>We've been playing with some NCR Wavelan cards.
... stories of playing with 900mhz lans follow...

>In many urban areas the 900 MHz band is filled with thousands of
>these things running in offices, thousands of VCR Rabbits sending
>TV signals, vehicle locator systems, hams, and anti-shoplifting
>systems, as well as some old ISM equipment drying plywood. It's
>rapidly becoming like class D CB with everyone boosting power
>trying to make shorter and shorter hauls.

Thanks for confirming my suspicions. as I hinted at eariler, I was
trying to set up a usenet feed site sans phone lines. My qth is
rather close to metro boston but has remarkably bad phone lines. I hoped
I could use radio to bypass the telco but it looks like I'd be trading
one set of headaches for another.

After I made my posting, my subscription to the new england
community internet project's mailing list kicked in. as fate would have
it, one of the "problems" faced by cheap internet advocates is the cost
of connectivity. I think there are other, larger, problems like selling
the concept to joe and jane "the computer is magic" user and supporting
joe and jane without giving up on sleep but that is another story.

anyway, the cost of bandwidth and control of content remain an issue.
I believe that some form of unlicensed but hopefully coordinated spectrum
for point to point WAN use is needed for things like the community
internet project. Along those lines, I would like to see something
like don stoner's(?) proposal for a digital CB in the 6m band be reworked
for the 220-222 mhz spectrum UPS just gave up on.

what do you think?

I have a Baycom modem and the baycom software version 1.5. I have
tryed running it through Windows3.1 but have had no luck. It works
perfectly well when running under Dos, but i would like to use it under
windows.
If anyone has anydetails on how I can do this then I would be very
grateful. Also does anyone know of anyother softwre that will run
with baycom and windows. I have been told about a program called
graphics packet but i have not been able to get hold of a copy. Can anyone
tell me if it is avaliable on ftp sites.
Many thanks in advance,
Matthew

I recently received a copy of AmiPac, packet terminal software written for
the Amiga. The only thing I've not been able to do is get the speech
synthesis working. When I select the video>speak menu option I'm greated
with a requestor asking me mount volumn "SPEAK:" in any drive. If I assign
SPEAK: to DH0: (my system device) I don't get the requestor but I don't
get any speech either. For that matter if I assign SPEAK: to RAM: I get the
same results.

So if anyone out there has had any luck getting this fine shareware to talk
please let me know what you did.

Actually it is supposedly possible to decode it off the air on 3330,
7335, or 14670 KHz. 7335 operates at 10KW the other two at 3KW, but
even so 14670 is usually the best frequency in the daytime.

Thanks for the program, I'll see if I can get that to work with my HF
receiver.
By the way there is also encoded time data that is broadcast on WWV,
WWVH, and WWVB that can some how be decoded.
I've seen an ISA board with a 10 MHz receiver and TSR for DOS to keep
your computer in sync for about $350 US.

This looks like a good application for the TAPR Metcom device. It's a
small single chip micro that hooks to a TNC and has A/D converters,
digital input, and digital output lines. You hook up what you want
monitored to the Metcom, do a connect to the TNC from the chase car,
and get the telemetry. Since it also has outputs, you can send commands
to the Metcom to control things on the car.

Note, you may want to do this on a commercial frequency rather than
amateur radio. That's not a big problem, packet is allowed on certain
commercial frequencies, and the radios are similar to amateur rigs.

Gary

The device is the CS660 by Command Communications Inc. It handles
answering machines, fax, phone, and modem all off of one line.
You can program it's behavior, even making it change it's behavior
based on time of day. It generates ring signals on it's output lines,
so after it decides which device the call should be routed to, it
makes the device think it's on an outside line. For outgoing service,
it generates a busy to the devices when one of them has the line in
use. So you don't have to rewrite any scripts, as far as your dialer
is concerned, it's on a single line. I really like this box. It's a
lot smarter than most comswitches.

>
>what do you think?

Well I'd rather have it back for hams, but if not, that's a reasonable
option. Nailed up point to point links are best done at microwave, however,
the VHF spectrum probably is better suited to broadcast protocols. That's
a reasonable way to distribute Usenet though. Regular phone modem links
could handle the back feed volume.

Gary

Can someone tell me where to get hold of the K5JB package for
DOS? I looked on SIMTEL, but no luck.

Thanks in advance.

Thanks to Anders, N2JGL, AmiPac now talks.

He reminded me of the Speak-Handler provided with Amiga DOS 1.3 and 2.04.
All I needed to do was "mount speak:".

Thanks again Anders!

Type 'param <if> 255' in on the NOS command line. Substitute <if> with the
correct interface name that was defined in an earlier attach statement. It
always works fine for my TNC. (I have a TNC2S-DK9SJ connected to a 27MHz CB
transmitter).

Hi folks,
I'm running Linux v0.99pl9_1 (i.e. current) and WAMPES 930405 (I think) and
they work together at the moment (just, FTP and outbound SMTP seem to be broke)
but I've been thinking..

Can I set up Linux to use WAMPES as a router so the TCP things work directly,
just using WAMPES as a router? I've been playing about a bit and have managed
to get some error messages down the loopback port but everything is corrupted.

How do I go about configuring this? Or, indeed, is it possible?

I'm currently trying with:

router (WAMPES) = 44.131.4.105 (calvin.g7gpa.ampr.org)
host   (Linux) = 44.131.4.86 (hobbes.g7gpa.ampr.org)

with Linux configured to route through /dev/loop0 and using 44.131.4.105 as a
router. I think the key may be in the WAMPES attach command.. but who can
tell?

Any help, kind notifications that this actually can't be done, or anything else would be greatly appreciated..

Cheers es 73,
Mike

Tim Holmes (holmes@gorilla.nbn.com) asks about the availability of the
K5JB tcp-ip package for DOS. To my knowledge, this is not available
anywhere by ftp, however it is available on disk from:

Tucson Amateur Packet Radio
P.O. Box 12925
Tucson, AZ 85732-2925
602-749-9479 (Tue-Fri, 10am - 3pm MST, 1700-2200 UTC)
FAX 602-749-5636

The latest released version is k28, dated 12-92. I use it myself, it
works great in about half the memory required for NOS and runs weeks on
end without any memory problems. I think it is disk package #11/11a in
the TAPR library (two disks, 5-1/4 in. -$4.00- or 1 3-1/2 in. disk
-$3.00- including postage in the U.S.).

I've been reading about the various DSP modems now being sold for high
speed digital communication over telephone lines. These boxes would
seem to have most of the makings of a TNC, eg DSP chip and D/A converter
to deal with the analog signal, and a CPU to control things. I was

wondering if anyone was currently working on building such a beastie.

I only have basic programming skills, and so could offer myself of
ancillary coding and bug searching. But if anyone is working on such a
project I would be interested in hearing from you.

>Secondly, are such activities legal? If they are, are they sanctioned at all?
I have been thinking of setting a similiar system up on my station, it's
really technical matters that are slowing me down. I also want to get the
actual mud set up as well.
I do know of people doing this, already. How well known they are is another
thing.

I'm not too sure on their legality, it changes from country to country and
from interperation to intepretation. As I said before, I'm going to give
it a go so I think it is OK here.

I mean ftping/yap xfering the latest version of Pd tetris is Ok.

I have got the "NET/Mac(2.3.20) update".
But it does not work at all.

The NET/Mac 2.3.20 that I have was modified
in march 31 (I have got this information from
the GET INFO.), even though the Updater says
it is for NET/Mac 2.3.20 modified in March 30.

Any information will be appreciated.

Yutaka Sakurai/JF1LZQ
YOKOHAMA JAPAN

P.S.
The USENET-compatible news distribution
system for NET/Mac has been developped.
This is called KNews/Mac.
Of cource it is compatible with TERAKOYA
system.(TERAKOYA is the USENET-compatible
news distribution system for KA9Q in DOS
developped by PRUG.)

Assuming you have AmigaDOS 1.3 or 2.0 you need to mount the SPEAK:
device. There should be a mountlist entry for it on your standard
AmigaDOS release diskettes. Since you have a hard disk, if you installed
AmigaDOS "by the book", you should be able to simply add "mount SPEAK:"
to your startup-sequence in the s: directory and you'll be talking up a
storm. If you need more help email me privately.

Eric the Supra Send/Receive Fax modem has the recognition software written
into their chip set and it is designed to work with STraight FAX. The AEO
had a nice write-up that indicated it worked flawlessly.

CALL FOR VOTES
REC.RADIO.AMATEUR REORGANIZATION

This is an official Call for Votes for the reorganization of the
rec.radio.amateur hierarchy of newsgroups. This vote will be conducted
according to the official newsgroup creation procedures, which are posted
regularly in news.groups.

Votes may be cast only with the simple fill-in-the-blanks form which appears
in the "HOW TO CAST YOUR VOTE" section later in this CFV.

SUBJECT OF VOTE

All of the newsgroups proposed below are UNMODERATED.

   rec.radio.amateur.digital.misc
     amateur packet radio, RTTY, AMTOR, Clover and other digital amateur
     radio modes (This replaces rec.radio.amateur.packet and adds other
     digital modes to the subject)

   rec.radio.amateur.digital.tcp-ip
     TCP/IP via amateur packet radio

   rec.radio.amateur.dx
     DX (long distance) amateur radio communications

rec.radio.amateur.antenna
  amateur radio antennas: theory, techniques and construction

rec.radio.amateur.equipment
  amateur radio equipment: manufactured products and modifications

rec.radio.amateur.instruction
  amateur radio instruction & examination

rec.radio.amateur.operating
  amateur radio operating procedures and techniques

rec.radio.amateur.homebrew
  amateur radio construction & experimentation

rec.radio.amateur.space
  amateur radio in space: amateur radio satellites, earth-moon-earth
  (EME) communications, space shuttle, MIR space station, etc.

rec.radio.amateur.emerg-services
  emergency services: RACES, ARES, NTS, and other use of amateur radio
  in emergencies or disasters

rec.radio.amateur.rdf
  radio direction finding: recreational hunts and searches for
  interference

Two existing newsgroups will not be affected by this vote. They are rec.radio.amateur.misc and rec.radio.amateur.policy. They do not appear on the voting form and no changes resulting from this procedure will apply to them. rec.radio.amateur.digital.misc will replace rec.radio.amateur.packet if it passes, otherwise rec.radio.amateur.packet will remain unchanged.

DURATION OF VOTE

Voting will commence when this CFV is posted. It will continue until 9 June 1993 at 23:59PM UTC.

Voting procedures are detailed in the next section, "HOW TO CAST YOUR VOTE."

Upon completion of the voting period, the results will be posted to news.announce.newgroups, news.groups, rec.radio.info and all the current rec.radio.amateur.* newsgroups. In order to pass, newsgroups must have at least a 2/3 majority of YES votes and at least 100 more YES than NO votes.

HOW TO CAST YOUR VOTE

Jay Maynard, K5ZC, is serving as vote-taker for this vote. Please REPLY to this message via MAIL to his account, jmaynard@oac.hsc.uth.tmc.edu; using your newsreader's "mail a reply" command on this message should work. Posted votes

can not be counted. You will receive a reply within a few days after your votes are received which indicates how the vote counting software thinks you voted - please mail corrections immediately.

PLEASE USE THE FORM AS IT IS.

Please do not delete anything between the "-=-=-=-=-" lines - and most certainly do not monkey with the group names. Votes will be tallied by an automatic program and if it can't determine your vote you will be asked to re-vote.

For each group that you wish to vote on, simply add your vote in the appropriate space on the same line. Recognized votes are Yes, No, For, and Against. Yes and For are equivalent, as are No and Against. Capitalization is not important. If you want to abstain from voting on a particular group, just leave the space blank. Don't worry about spacing of the columns or any quote characters ">" that your reply inserts.

You may _NOT_ do a combined vote - i.e., "I vote for all of them" or "I vote against all of them." Please use the form.

You may only vote once, regardless of how many accounts you may have. Forwarded or proxy votes are invalid.

Subject: pmnos under OS/2 2.1
Message-ID: <1993May10.151514.6391@dde.dk>
Date: 10 May 93 15:15:14 GMT
Organization: Dansk Data Elektronik A/S
Lines: 20

I have been using PMNOS ver 1.0d under OS/2 2.0 for a while now, last friday
I upgraded to OS/2 2.1 and the software has not been working since.
I simply cannot make even the simple ax25 part work, disabling everything else
in the software (there are tons of stuff in there).

I can run Wnos ver 4.0 in a DOS box without troubble, so thats what I do right
now. But I would very much like get PMNOS working under OS/2 2.1.

Does anyone here know of a newer version of PMNOS than ver 1.0d, and where
couldI get it from? (ftp or modem in europe).

If anyone here has got PMNOS working rock solid, I would like a word from him.
Its nice to be able to run the NOS software as a native OS/2 task, but PMNOS
seems to have som problems with OS/2 2.1.

Greetings from Denmark

K5JB version of code is available by anonymous ftp from ucsd.edu.

Look in /hamradio/packet/tcpip/k5jb. Latest version is the k28
version. Don't know if the kit includes binaries for DOS or
not but it does have the source code and makefiles for both
DOS and UNIX.

I assume you're running the March beta; there's a known bug in the COM.SYS
driver. Download m21com.zip from software.watson.ibm.com, in the
/pub/os2/os2fixes directory. I'm not running PMNOS any more, but this should
fix your problem...

Hello,

I am planning to buy a Kenwook Hand held Transceiver, TH78a, within few days
time.

Has anyone got it going with packet radio ? I need some comment for
it performance (or even it didn't work!), since my main interest is
packet radio.

Or just simply few work saying whether it work with packet radio
or not ?

Thanks in advance,

Thomason FAN.

Keywords: rules packet third-party

Current FCC rules allow for the "participation" in amateur radio by non-licensed people. With HF, I have taken this to mean that if a licensed amateur was controlling the station, provided the communication was between US stations, a non-ham could speak into the mic.

I assume that this extends to packet via BBSes and direct. I.e. as long as a licensed ham is in control of the station, a non-licensed individual may enter in a packet message to send.

I do a lot of demos at schools and with the scouts. In the past I have mainly done HF and VHF, only recently starting with packet.

Thanks for any comments

Bill

Many thanks to everyone that that sent me the ftp address of the program,
but before loading the program I didn`t relise that it was in German. Does
anyone have an English version of the manual?

Many thanks,
Matthew

I think you are alright with this. I believe this is treated like any other third party traffic. Which means that it is approved for domestic contacts and Dx contacts with stations in countries that have 3rd party agreements with the US. I think there is a list of 3rd party nations available via the ARRL mail server, but I'm not sure. Not only can an unlicensed individual send a packet while you are at the keyboard they can also mail the packet to you and you can pass it on from the internet to ampr. There are a couple people who provide just such a service on the 'net. I don't have the information here now but e-mail me if you want more info. Keep up the good work. We can use all the GOOD hams we can get.

Dan

I downloaded the contents of this directory by anonymous ftp
and when I tried to uncompress the .Z compressed files, I found
they were all corrupt. I used binary (image) transfer so I
think the sources at ucsd.edu may be corrupt - has anyone else
had this problem ?

I tried to decompress the .Z files on a number of different
machines with different flavours of Unix, but got the same
result each time.

Hi

I have read the FAQ and it has still left me with a few questions. I have just taken the RAE and am hoping to set up a Packet BBS/Gateway here at the university to serve a small group (10 to 20) of licensed students all on a fairly low budget.

I am also about to buy a radio and want to make sure it is capable of being used for packet operation.

We want the BBS to be able to give us access to our local UNIX system, this could be done either directly via a network board in the pc using TCP/IP or a serial link to a PAD.

We need a minimum of 1200 Baud, the faster the better, an ideal would be 9600 Baud. What sort of Radio/TNC would we need to do this and what sort of cost are we talking. It will be running either on 2M or 70cms on a dedicated PC.

Hope I have provided all the information here

Thanks In Advance

Kevin

Hi, I run a MUD on packet (have done since last Sept), well to be excact
it is a MOO, version 1.7. Here is a flyer I sent round a while back.

  Hi folks, well some of you may remember I sent a message out to #nw
back in September, detailing the MUD I had just put on line then. Well
the MUD, BayMUD (a version of TinyMUD) evolved rather well, attracting many
players, and a fair amount of interest. The mud started with some 900 objects,
and to date has over 2000 objects, including 308 rooms.
  Well since then things have progressed, I still have BayMUD on my system,
but have recently established another much newer type of MUD, this time called
, MOO (Mud Object Orientated), that is to say it has its own in built programm-
ing language, and is a much more sophisticated style of mud. This can be
accessed by typing 'baymoo' whilst logged onto my system, or type 'baymud'
for the mud.
  Though the MOO is more sophisticated than the MUD, this does not mean to
say it is any harder to use, it just has a larger array of command, and many
more things can (if need be) be done with it.
  Just a quick recap for those that did not see my earlier message, or are
unsure of what a mud/moo is:-
  A MUD (Multi User Dimension/Dungeon) is basically a computer program, and
database, that multiple users can connect to and explore. Each user takes cont-
rol of a computerised character or persona. They can walk around, explore, chat
and interact with other users, solving puzzles, battling with monsters, and
even creating there own rooms, objects and descriptions.
  My station G6PHF, can be accessed from any of the WC nodes, or through the
LA20 node on 144.625, (or direct). So if you find yourself with a few moments
to spare over the holidays, why not logon, join us and have some fun.
  If any of you require any further info, don't hesitate to contact me on my
system, or as g6phf@gb7ulv.

I run this under SysV Unix on my PC using Wampes tcpip software, I forgot to
say above users can telnet direct into the MOO on port 7777.
So in short it can be done |-)
73, Mike
p.s. Do not Reply to the address this mail came through, it is kind of one way!

You've to wait until there's a SLIP-implentation for Linux available.
With SLIP you can attach a pty with WAMPES on one, and Linux-SLIP on the
other side. Worked with a patched alpha-SLIP very well for me and others :-)

Hi all,

First, I'm sorry if this question has been asked/answered to death. (I did

read the FAQ).

I'm interested in setting up a 9600 baud point-to-point link between a PC running, say Kermit and one running Linux (unix-like). Distance = 2 miles. At this point I have one 14.4K modem and no radios...:-)

Can two 2 meter HTs be used at this speed, assuming I get another 9600 baud modem? Or could even simpler/cheaper 2m hardware be used? (ie, are there single board tranceivers that would work?) If so, who makes them and how much do they cost?

If you have done this, and wouldn't mind sharing some hints with a packet "wanna-be" :-), I'd appreciate hearing from you. Thanks...

73,
pat KA2AYK

Hello dr Om's and YL's

I am looking for the programm 7Plus for decoding binary files that I
recieve from the BBS. Does anybody knows where I could find this
programm. Or is it possible to use any other decoding programm (uudecode or
something else). I'm looking for a version either for a PC or an Amiga 500.

Many thanks in advance for your help

Pat, the radio circuit is normally half duplex. Most phone modems have no way to force them into half duplex, other than the old Hayes Smartmodem at 300 baud. There's normally a handshaking process at call setup (which may include a training sequence for the higher speed modems) that mandates a full duplex circuit. And of course the tones are wrong to interoperate with others using packet modems. So you're not going to be able to use phone modems unless you setup a full duplex link. You could do this by setting up two sets of continously on transmitters and receivers, likely on different bands to aid the desense problem, and using 2 wire to 4 wire networks on each end. This can be expensive, and ties up spectrum, but it can be made to work. It's not the approach used by packet operators, however.

To operate packet, you need three things besides the radio, a compatible half duplex *synchronous* modem (packet uses HDLC synchronous transmission), a PAD (Packet assembler Disassembler), and a channel access controller. These three things are normally built into a box called a TNC (Terminal Node Controller), but there are other ways of implementing the PAD and channel access functions. For example, Baycom type units do this in software on the host. That's normally not workable unless you can dedicate the low level resources of the host to the application, however. A Linux host is going to expect a normal asynchonous RS-232 data stream, as is a terminal program like Kermit.

Note that since AX25 packet is an error detecting protocol with re-transmission (ARQ) at the link level, you normally wouldn't attempt to layer on another error checking protocol like Kermit. (Note: a transport protocol on top of AX25 *is* a good idea for certain applications, see TCP/IP, but Kermit, Xmodem, and the like are *not* suitable for use on the long turn around delay packet network. They are better suited to duplex links.)

Normal practice is to use a TNC and FM radio running AFSK on 2 meters for 1200 and 2400 baud packet operation. 9600 baud and higher speeds are normally done on 222 MHz or higher due to FCC regulations. It's possible to do 9600 on 2 meters, but holding it's spectrum inside the 20 kHz limit is an issue. You can run a PSK modem through SSB equipment, or if you're careful, you can use FSK modems like the K9NG and hold the spectrum inside 20 kHz, but normally the higher speeds are done on the higher bands where such strict bandwidth limits are not present in the regulations. This doesn't present many practical problems since equipment for 222 and 440 are widely available, and since there are bandplanned frequencies for packet operation on those bands as well.

While many amateurs attempt to use HTs for packet, they are not really a good choice. In most cases, a base radio, or mobile pressed into base service, is a much better choice. Often you need the gain of an outside

antenna to reliably make a circuit, and HTs are too sensitive for use on outside antennas because they are normally designed to work with an antenna with negative gain, a rubber ducky. Outside antennas are important for another reason as well, to get away from the RF hash produced by the computer and monitor. Also, at baudrates above 1200, you normally have to go inside the radio and make connections directly to the modulator and discriminator to pass the packet waveforms. This is a nightmare on the tiny surface mount circuit boards of the typical HT.

One final caveat. If you are accustomed to the thruput of 9600 baud duplex phone links, you'll be disappointed in packet radio thruput. Due to the half duplex nature of most packet, and the resulting turn around delays, and due to the overhead of the packet protocol, your actual thruput will be much less than half that of a duplex phone link with the same baudrate. If you additionally use "digipeaters" or "nodes" to relay your signals, you'll see an additional halving of the effective baudrate for each hop since they must receive your transmission, store it, and retransmit it on the same frequency. (There are ways around this too, requiring duplex repeaters or large sliding windows on cell-like topologies. This is the subject of advanced experiments.)

For automatic Email and file transfers, I find 1200, and even 300, baud links tolerable. For interactive operations, however, 9600 baud is my minimum tolerable speed, and 56 kilobaud is much better. You can even use vi without much pain with a 56 kb link. (It jerks a bit, like a Telebit modem in PEP mode.) Packet is a different world than telephone modem communications due to the different nature of the channels and the methods of access.

X-Software: HERMES GUS 1.03 Rev. Apr 14 1992

I have been experimenting with pe1chl 920218tc for about six months. I've
had it longer, but have only been able to use it for the last six months.

I understand that there is an updated version out dated 930411 and that
it is available for FTP from ucsd.edu. I am using a FTPMAILSERVER to
request it and expect it will arrive in the next few days.

Two things prevent me from fully implementing TCP/IP at my station. The
first is the lack of a SCII interface for the midi ports. I use a 1040STe
and need the additional comports that the SCII device supports. If anyone
has such a device, or can send me a schematic or template for constructing
one, it would be much appreciated.

My second problem has to do with the BM.TTP. The version I have only includes
the commands (B)ye (I)nfo (S)end, and the info command doesn't work. I
currently run a fulltime 3rd party enabled maildrop for my community. I
would like to expand that to include a full time BBS. Even a limited one
would be agreeable. Does anyone have a suitable BBS program that will
run inconjunction with pe1chl? I would prefer a full featured BM but
will be glad to hear any other suggestions.

Terry

Here in the Silicon Valley, callsign lookup is available both via
Telnet and by an AX.25 connect. Miscellaneous files are available on
the main TCP/IP gateway (sanjose). Of course, regular PBBSs and
PacketCluster nodes also have lots of files available. (We have
lots of PBBSs and cluster nodes here.)

>Do most of the packeteers in your area use packet to 2-way QSOs, or
>do you rely on Personal Message Systems and BBS messages to contact
>fellow hams?

I don't know of anyone who does realtime keyboard-to-keyboard
connections, but Kinsey reports consistently note the presence
of masochists in the general population, so there probably are
some people doing this. :-)

>What "enhanced" digipeating systems are in use in your area (NetROM,
>ROSE, TexNet, etc.)?

NET/ROM plays an important role in PBBS network backbones. I'm
not aware of the other two modes being used in this area. Of course,
we have a bunch of TCPers around here. That channel is nearly always
humming with mailing list messages that have been relayed from
the Internet as well as with regular messages. (We have at least
two packet/Internet gateways in the Bay Area.)

(Greg) writes:
|> Does anyone run any Internet to Packet gateways on the east coast?

I would like to but I have questions about the regulations involved in doing
so. The machine(s) I have are hooked up on both the Internet and packet. By
hooked on the Internet, I mean that I not only have E-Mail but I can route
IP packets to/from the rest of the Internet.

What I would *like* to do is figure a way to allow packet-to-Internet bridging.
Unfortunately, from what understand about the rules and regs for hams, I can't
do this, because I am responsible for whatever information crosses that bridge,
which would require that I (probably manually) review EVERY packet. Clearly,
this could not be achieved (with or without an expert system).

Even something as simple as an E-Mail gateway is troublesome. Again, the same
rules and regs apply, so that means that I would end up reviewing every message
that goes through the gateway.

Am I simply mis-informed? How do the other maintainers of gateways deal with
this? Has anybody else considered an Internet/packet bridge and if so, is it
up and running, or why didn't you go through with it?

Thanks in advance - Marc

>Dave, do you mean Internet address of david@stat.com ??
>Or is gate@wb7tpy.ampr.org a valid Internet address?

All the ampr.org addresses are valid Internet addresses.
Whether they are connected to the rest of the Internet is
another matter... :-)

In fact, there are a couple of easy ways to do this. One way
is to put an ampr.org host into another Internet domain. Try
pinging mac.n6bis.ampr.org and you'll see what I mean. I don't
have that system connected to the Internet right now, so there
won't be any response to the ping. But it's still listed in
the nameserver and you'll see that it is not within Net 44.

Yet it was fully on the Internet when it was hooked up.

Dave has taken another approach: he's using a regular Internet
host to forward mail to his ampr.org machine:

```
% nslookup
Default Server:  apple.com
Address:  0.0.0.0

> set q=mx
> wb7tpy.ampr.org
Server:  apple.com
Address:  0.0.0.0

wb7tpy.ampr.org preference = 10, mail exchanger = wb7tpy.ampr.org
wb7tpy.ampr.org preference = 20, mail exchanger = enuucp.eas.asu.edu
wb7tpy.ampr.org inet address = 44.124.0.1
```

So, as has been stated here numerous times, the name is not the
address, the map is not the territory, and you can't assume things
about an ampr.org host's physical connectivity from its name!

Patty

p.s. Please, everyone, edit out the extraneous parts of
previous postings (headers, irrelevant text from the body
of the message) when you do a followup!

>   a) Is there any packet software out there for the MAC? If so,
>   does someone have an FTP where I can get it from?

  Yes there is! I've written two packet radio programs for the Macintosh. One is called Virtuoso. It is a terminal emulator which requires a full blown TNC. It is shareware so you can try before you buy. The other program that I have recently completed is called Savant. It works with any TNC that supports KISS mode or the PacketMac modem (read below). Savant provides a true multi-window, multi-connection Macintosh user interface to packet radio! Demo versions are available!

  You can get Virtuoso and the Savant demo from: cpre1.ee.iastate.edu in the /pub/ke0ph/ directory. Let me know if you want any more information on either of these products.

>   b) Is there something like Poor Man's Packet, where the software
>   emulates a TNC? I have heard that there is a similar program
>   available for the Mac...

  Yes there is. You can get the PacketMac modem from Sigma Design Associates. It is a kit similar to the Poor Man's Packet, but it is designed for the Mac. For more information, look at the cover story in the October 1992 issue of 73 Amateur Radio Today. You can contact the designer, Dexter Francis, at francis4@applelink.apple.com. The kit sells for around $30. He also has some assembled units available.

  You can get going for MUCH less than $500. The radio that you need depends on how close you are to the station you are going to be connecting to and what kind of antenna you can constuct. A small hand-held 2-meter rig may even do the trick. Just as long as it can accomidate an external microphone and speaker.

Hello all from Phoenix,

A couple of years ago I saw a poster that diagrams the freq. spectrum and
its respective owner (ie..military, ham, commercial, ect.) and was in full
color. Does anyone know where I can get one of these posters??

Thank's ...Mitch

We *will* get the latest ROSE X.25 Packet Switch code up to one or more
ftp sites soon... Sorry for the delay.

Meanwhile, for the cost of a phone call the code can be downloaded from
the KB7UV ROSErver/PRMBS at 718-956-7133 (14400 bps V.32bis V.42bis, but
actual data speed is affected by system loading -- upgrade is in the
works, again soon.)

BTW, the latest release of the ROSE X.25 Packet Switch is version 3.3.

73, Andy

There are many of these gateways available. One is the WB7TPY gateway
down in Arizona, and the usage file is being widely distributed within
this group.

In Steve Watt's FAQ's (Version 1.13 - Last modified 2/21/93), another
one is listed, but seems to require that the user on the Internet side
must have an assigned callsign :

>...
>2.4 Are there any gateways for mail or news between Internet and

Rich and whomever else might be interested--

The only one I know of that works with normal TNCs (the other one
requires its own special hardware) is:

     APR (Apple Packet Radio)
For use with TNC-2s. Send a formatted 5.25 or 3.5-inch disk
and a stamped, self-addressed disk mailer to Larry East, W1HUE,
P.O. Box 51445, Idaho Falls, ID 83405.

I just checked the callsign server and noticed that Larry has
a street address listed there, so if the P.O. box doesn't work,
you might try his home address. This information is a couple
of years old, so I can't guarantee that Larry is still offering
this program.

  Does anyone have any experience with a new brand of TNC brand name called DRSI? There prices seem very reasonable. The DPK-2, which seems to be a KPC-2 clone is $114.95 in the catalog.

  I also see a TNC that advertised as 4800, 9600 & 19,200 baud. Is this for normal Packet operation. Or is this for backbone systems?

  Thanks in advance...

  Here is the main address, from that you can get the phone number.
     DRSI (Digital Radio Systems Inc)
     2065 Range Road
     Clearwater, FL  34625

  I just receive my DRSI catalog yesterday...  I'm sure they would be
happy to send one.  At home I have the Compuserve User Id for a sales
person.  E Mail me to my Internet Address and I'll bring in the
Compuserve Id tomarrow.

  SoftKiss by Aaron Woyl (N3LIW) can drive the Baycom modem on a Mac.
Why do you not want KISS mode? To my knowledge, that's all that you can
get from a packet modem like the Baycom. Then you run an application like
Savant to provide a nice interface for ax.25 communications.

I originally tried emailing this to Mike, wd6ehr, directly, however, it
got bounced as undeliverable, so I have decided to post it to the group
in hopes that someone may have suggestions on how to rectify the problem.

A bunch of us up here in the Twin Cities are about to install the first
packet/Internet gateway in Minnesota, however, we've come up to a
stumbling block.

We were planning on on using a Kantronics D-410 with a TAPR 9.6k modem
for the RF side of the gateway, unfortunately there appears to be some
incompatibility between the two. Both the radio and the modem work fine
in other combinations, but the two don't seem to want to work together.

The modem seems able to modulate the D-410 just fine, however, the
analogue output from the discriminator gives very poor results with
only occasional, VERY strong signals being demodulated. The DCD LED
does show some transitions being received, however, that is it!

We have tried two different modems with almost identical results :-(

Are you aware of any similar problems and (hopefully!) solutions that
you could email to me?

Thanks in advance.

I run an internet e-mail <==> Amateur Packet BBS <==> Amateur tcp/ip mail
gateway. My users all follow a single guideline. "Don't do anything that
will result in the SYSOP showing up on their doorstep at 3 AM with a 12
gauge shotgun and a copy of an FCC NAL."

It has been in operation for over a year without any problems other than
a local buffoon that tried to upload a 30K file as a Packet BBS message.

Yes, I have had experience with the DRSI TNC that you speak of. DRSI has been
around for quite some time now, so their not new to the packet streets. The
DPK-2 is a TNC2 Clone, not a KPC-2 clone, quite a difference I might add.
A TNC2 clone is from your old TAPR TNC2 days, that now folks like MFJ are
still cloning with their MFJ-1274's and 1270's...

Ok, so from what I can gather based on various postings and E-Mail sent directly to me, there are 2 methods being used to connecting the Internet with Packet. The methods are:

1) The "trust" method. This is employed by gateways that simply provide a bridge for packets to move from Packet to the Internet, typically, using NOS. Users of these gateways are "trusted" to do-the-right-thing. Connection originating on the Internet are NOT permitted to go through the gateway onto Packet.

2) The "screen" method. This is employeed by gateways that only provide E-Mail pass-through between Packet and the Internet. Messages going from Packet to the Internet go without reguard to content, while messages going from the Internet to Packet are read by a human and forwarded only upon acceptance by the sysop.

Option 1 is the closest to what I would like to provide, though the restriction of allowing connections to only be established from the Packet side I had hoped could be worked around in some fashion. Option 2 provides the best security against FCC issues, but really limits the features and timeliness of messages.

So, now that I am gaining a better understanding of what the options are that are actually being used, I will proceed with determining what form of gateway I will provide... The bottom line; I hope to have a gateway functional here in New Hampshire *soon*.

Marc--

You must have missed the postings that a couple of other people and I made
about the N0ARY gateway, in which hams (and they must be hams) who want to
send messages from the Internet to the PBBS system register with N0ARY so
that he knows who they are and can verify that they are licensed hams. From
then on, their messages travel freely through his gateway; there are no
delays for human screening.

Patty

p.s. I've maintained the default worldwide distribution on this followup
message, but are U.S. rules of interest to those of you in other countries?

I started and ran the San Antonio gateway for about a year before handing it
to N5LYT.... I found the "twisted pair" BBS method of real name registration
along with callbook info was all I needed to exert control... The ability to limit
user access to features is built in to NOS. Also nice is the "firewall" using
"ip access <address> <accept|deny> <port #> that prevents use in any direction of
certain services. The knowlege that abuse == elimination was the best control
mechanism around. The added nicety of having a "BBS" type port for non-ip users
added to the desirability factor....

Result: San Antonio has an active group of TCP/IP packeteers and is now adding
a 19.2K link frequency for high speed TCP/IP use only....

Marc, DO IT!...

1. Gary Ford's introductory document (about 50-60 pages) is available
via anonymous FTP from ftp.eecs.ucdavis.edu in the /pub/ka9q directory.
It's available in PostScript and non PostScript versions. Grab the
readme file first to find out about the various files in the directory.

2. Ian Wade's _NOSIntro_ book is available from the ARRL and TAPR, as
well as directly from Ian. Last I saw, there was also one copy on the
shelf at the Cupertino outlet of Computer Literacy. :-)

Greetings.

Could anyone please direct me to any FTP site carrying YAPP software for
the PC?

Thank you much.

Direct replies preferred. I will summarize if requested.

I'm a licenced radio amateur in Australia and travelling to the USA. Can anyonE
give me any help with frequency allocations and restrictions for operation. I
know I have to fill out a 610A application, but would like some general info
on spectrum allocation etc.

Any and all info greatfully received.

Thanks for pointing that out, though I must admit that I brushed that idea aside
because I can think of too many ways for abuse in that situation (a non-ham
could easily send a message through such a connection, provided they new what
header lines of the message needed to be faked).

Well, there is little question that I am going to do *something*. The question is now details, such as what freq's and speeds are best? Which of my machines will best host NOS (careful, all I have are non-intel u*ix machines currently, though an Alpha running NT is on its way here). I have a desire to get up on a 19.2k bandwidth connection, but from my roaming around, I don't think that I would be providing much of a service due to lack of connectivity with the bulk of the packet community. 9600 is probably the slowest I would want to go, but then again, I would be the one using it, other would.

Any suggestions as to equipment and connectivity for the southern NH area?

Thanks in advance - Marc

Does anyone know of how to modify the KAM to include a battery backup for the RAM? I believe there is an option to do this that includes a clock chip, but is there just a simple mod to save the Mailbox data when the power is off. (Perhaps the S/W needs the clock chip to see if the data is good? Anyone know?)

Michael

Frequently Asked Questions for Amateur Packet Radio

Version 1.13 - Last modified 2/21/93

This document is for unlimited distribution.

Please send corrections and additions to:
   packet-faq@wattres.sj.ca.us
Which will expand to a list of people who are familiar with most packet
issues. I hope. ;-)

The Packet Radio FAQ's will be posted on a monthly basis to
rec.radio.amateur.packet. The current version of this document is
available via anonymous FTP at ftp.cs.buffalo.edu.

Many FAQ's, including this one, are available on the archive site
rtfm.mit.edu in the directory pub/usenet/news.answers. The name under
which a FAQ is archived appears in the Archive-Name: line at the top
of the article. This FAQ is archived as radio/packet-faq.

There is also a mail server on rtfm.mit.edu, which can be addressed as mail-server@rtfm.mit.edu. For details on how to operate this server, send a message to that address with the word "help" in the BODY of the message.

          ROSE
   3.4 BBS message transfer

1 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small bursts, or packets.

1.2 What is amateur radio?

Amateur Radio (sometimes called Ham Radio) is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions posting in rec.radio.amateur.misc. A copy of that FAQ is also available from ftp.cs.buffalo.edu.

1.3 What can I do on packet radio?

Keyboard-to-Keyboard contacts:

Like other digital communications modes, packet radio can be used to talk to other amateurs. For those who cannot use HF frequencies, two amateurs can talk to each other from long distances using the packet radio network.

Packet BBS operations:

Many cities have one or more packet Bulletin Board System (BBS) available on the local packet network. Amateurs can check into the BBSes and read messages from other packet users on almost any topic. BBSes are networked together over the packet network to allow messages to reach a broader audience than just your local BBS users. Private messages may also be sent to other packet operators, either locally or who use other BBSes. BBSes have the latest ARRL, AMSAT, and propagation bulletins. Many BBSes have a file section containing various text files full of information on amateur radio in general.

DX Packet Cluster:

A recent development is use of packet radio for DX spotting. HF operators connect to the local DX Packet Cluster for the latest reports on DX. Often a user will 'spot' some hot DX and distribute the DX report real time.

File Transfer:

With special software, amateurs can pass any binary files to other amateurs. Currently, this is done with TCP/IP communications, YAPP, and other specialized protocols.

Satellite Communications:

Many of the amateur radio satellites contain microcomputer systems that can provide special information to amateurs. Some satellites contain

CCD cameras on board and you can download images of the earth and the stars. Others provide store and forward packet mailboxes to allow rapid message transfers over long distances. Some satellites use AX.25, some use special packet protocols developed for satellite communications. A few transmit AX.25 packets over FM transmitters, but most use SSB transmissions.

1.4 Why packet over other digital modes?

Packet has three great advantages over other digital modes: transparency, error correction, and automatic control.

The operation of a packet station is transparent to the end user; connect to the other station, type in your message, and it is sent automatically. The Terminal Node Controller (TNC) automatically divides the message into packets, keys the transmitter and sends the packets. While receiving packets, the TNC automatically decodes, checks for errors, and displays the received messages. In addition, any packet TNC can be used as a packet relay station, sometimes called a digipeater. This allows for greater range by stringing several packet stations together.

Packet radio provides error free communications because of built in error detection schemes. If a packet is received, it is checked for errors and will be displayed only if it is correct.

With VHF/UHF packet, many countries allow packet operators to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBSes (sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to use the same frequency channel simultaneously.

1.5 What elements make up a packet station?

TNC (Terminal Node Controller): A TNC contains a modem, a CPU, and the associated circuitry required to convert between RS-232 and the packet radio protocol in use. It assembles a packet from some of the data on the serial line, computing an error check (CRC) for the packet, modulates it into audio frequencies, and puts out appropriate signals to transmit that packet over the connected radio. It also reverses the process, translating the audio that the connected radio receives into a byte stream on the RS-232 port.

Most TNC's currently use 1200 BPS (bits per second) for local VHF and UHF packet, and 300 BPS for longer distance, lower bandwidth HF communication. Higher speeds are available for use in the VHF, UHF, and especially microwave region, but they often require unusual hardware and

drivers.

Computer or Terminal: This is the user interface. A computer running a terminal emulator program, a packet-specific program, or just a dumb terminal can be used. For computers, almost any phone modem communications program can be adapted for packet use, but there are also customized packet radio programs available.

A radio: For 1200 BPS UHF/VHF packet, commonly available narrow band FM voice radios are used. For HF packet, 300 BPS data is used over single side band modulation. For high speed packet (anything greater than 1200 BPS), special radios or modified FM radios must be used.

1.6 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSMA (Carrier Sense Multiple Access). If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the TNC keys up the radio, and sends its packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet.

In actuality, a more complex scheme is used to determine when the TNC transmits. See the "AX.25 Protocol Specification" for more information.

1.7 What is AX.25?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified to suit amateur radio's needs. AX.25 includes a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the sender's and recipient's amateur radio callsign, thus providing station identification with every transmission.

1.8 Definitions: Commonly used terms in Amateur Packet Radio

44 net - The class A network designator for TCP/IP amateur packet radio. All numerical TCP/IP addresses are in the format

44.xxx.xxx.xxx.

AFSK - Audio Frequency Shift Keying. A method of representing digital information by using different audio frequencies modulated on a carrier.

AMPR - Amateur Packet Radio.

ampr.org - The high level domain recognized on Internet for amateur packet radio TCP/IP.

AX.25 - Amateur X.25 protocol. The basis of most packet systems. See section 1.7 for more information.

CRC - Cyclic Redundancy Check. The error detection scheme included in each packet. Verify that the packet was received error free.

CSMA - Carrier Sense Multiple Access. A system allowing many stations to use the same radio frequency simultaneously for packet communications.

digi - Short name for a digipeater

digipeater - A packet radio station used for repeating packets. See section 3.3.1 for more information.

FCC - Federal Communications Commission. Regulates and issues licenses for amateur radio in the United States.

FM - Frequency Modulation. The radio modulation scheme used for VHF and UHF packet communications.

FSK - Frequency Shift Keying. A method of representing digital information by shifting the radio carrier frequency different amounts to represent ones and zeros.

HDLC - (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

KA9Q NOS - (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

KA-Node - A simple networking scheme developed by TNC maker Kantronics. See section 3.3.2 for more info.

KISS - Keep It Simple Stupid. A simple interface developed for communications between TNCs and computers. This allows for most of the packet processing to be handled by the computer. Commonly used with packet TCP/IP software.

LAN - Local Area Network. A packet network developed for communications throughout a city or region. Often, the LAN uses

separate frequencies from inter-city packet links.

modem - MODulator/DEModulator. Converts the analog signals into a binary data stream (a series of ones and zeros) for the TNC or a micro-computer. First step in decoding packets. It also converts binary data to analog, which is the last step in encoding packets.

NET/ROM - A scheme for packet radio networking. See section 3.3.3 for more information.

NODE - A network node. Often a network node running NET/ROM.

PPP - Point to Point Protocol. PPP is another protocol used for moving IP frames over a serial line. It supports host authentication, and non-transparent serial lines. It also has a standard way of negotiating header (and potentially data) compression over the line. See also SLIP.

protocol - A standard used for intercommunications between different computer systems.

RS-232 (RS-323C) - A (more or less) standard for interconnection of serial peripherals to small computer systems. In packet radio, RS-232 is the most common interface between TNC's and the Computer/Terminal.

SLIP - Serial Line Internet Protocol. A trivial protocol for putting IP frames over a serial line to do (potentially) cheap TCP/IP networking. Approximately the same as KISS, except over wireline networks. See also PPP.

SSB - Single Side Band. The radio modulation scheme used for HF packet and satellite packet communications.

TAPR - Tucson Amateur Packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many others. TAPR continues development of packet radio equipment.

TCP/IP - Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more information.

TNC - Terminal Node Controller. See section 1.5 for more information.

1.9 Do's and Don'ts : Rules and Regulations

NOTE: These regulations apply only to amateurs regulated by the FCC (United States), but often are similar to regulations in other countries.

[Since I have no experience with amateur radio in other countries, I cannot make any comments. Please bring any notable exceptions to my

attention. -ed]

Although there are no specific rules that apply to amateur packet radio, the general amateur radio rules force some restrictions on packet usage.

> Can I set up a TNC at home and one at work so I can check my Electronic mail via packet?

This cannot be done without special restrictions. Amateur radio rules prohibit any business. Since you could have mail from your boss (or maybe even someone selling you something over Internet), that would constitute business activity and is specifically prohibited.

Profanity can also be a complication. Since you have no control over the language used in E-mail, proper filtering is required. Since no filter scheme can catch every offense, it is best to say every message must be hand filtered.

> I would like to set up a packet radio gateway between a land line computer network and the packet network. Is this possible?

Yes, and there are several such gateways in use, but they must be managed with caution. Electronic mail may be passed FROM the packet network INTO the land line network without intervention. However, mail passed TO packet radio is considered third party traffic (the sender is not an amateur) and these messages must be hand filtered to ensure that rules of message content are followed.

> It's my license if I use packet radio illegally anyway, so what does anyone else care!?

Packet radio is one of the few NETWORKED systems in amateur radio. Many people have helped develop the network and there are many amateurs who own parts of the packet radio network. Sending packet BBS mail, digipeating, and sharing the channel involves the licenses of MANY people. Because of FCC rules stating that anything to come out of a transmitter (either in automatic mode or via your direct control) is the licensee's responsibility, one illegal message sent over the packet radio network could literally jeopardize the licenses of thousands of other amateurs. When in doubt, it is best to check with other amateurs about sending the message before it is sent.

> I have some ideas on how to use packet radio in a new way, but I don't know if it is legal. Who could tell me if I can do it legally?

The worst thing you can do is talk to the FCC about such an issue. The

FCC rules are written to be general enough to encompass but not restrict new radio activities. In the past, any non-thought-out requests sent to the FCC have meant a reduction of privilege for all amateur radio operators.

The best source for legal assistance is your national amateur radio association. In the United States, that is the American Radio Relay League (ARRL). Another good place for such conversations is over Usenet/packet mailing lists, or the amateur radio BBS network.

2 Computing Network Resources for Amateur Packet radio

This section summarizes the resources available on Internet for amateur packet radio operators.

2.1 What Newsgroups/mailing lists are available?

This is a list of all groups that regularly discuss amateur packet radio. For newsgroups, join the group through use of your news reader. For mailing lists, add a '-request' to the end of the list name to request subscriptions. For listserv groups, send mail to 'listserv' at the node which contains the list. The first line of the mail should be 'SUBSCRIBE groupname yourname'. Send the command 'help' for more information.

rec.radio.amateur.packet (Newsgroup): General discussions involving Packet Radio.

rec.radio.amateur.misc (Newsgroup): General amateur radio discussion. Usually does not contain any particular information about Amateur Packet Radio.

rec.radio.amateur.policy (Newsgroup): Discussion of regulation policies regarding every aspect of amateur radio. Occasionally deals with policies of packet coordination and legal issues of packet radio.

rec.radio.swap (Newsgroup): General For-Sale for any radio equipment. Occasionally will have packet equipment for sale. Recommended location for any amateur packet radio for-sale items.

info-hams@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.misc Usenet discussion.

packet-radio@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.packet Usenet discussion.

ham-policy@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.policy Usenet discussion

hs-modem@wb3ffv.ampr.org (Mailing list): Discussion of high speed modems and radios available and future plans. Also includes discussion

of networking using high speed modems.

tcp-group@ucsd.edu (Mailing list): Group discussion of technical developments of TCP/IP over packet radio and use of the NOS TCP/IP programs.

gateways@uhm.ampr.org (Mailing list): Discussion of current gateways and future plans for gateways. May deal with sensitive internetworking issues.

listserv@knuth.mtsu.edu has several interesting mailing lists available:

GRAPES-L	Discussions with GRAPES (Georgia Radio Amateur Packet Enthusiasts Society) on 56kb WAN's and the WA4DSY 56kb RF modem that they distribute.
TENNET-L	Tennessee's efforts at a coordinated high-speed RF packet network
GRACILIS-L	Discussions on Gracilis tcp/ip packet equipment. Includes some of the people from Gracilis.
KA9Q-UNIX	Discussions on porting and using various versions of KA9Q Unix/Xenix NET/NOS under any of a variety of Unix/Xenix variants.
TNV-HAMS	General discussions amoung email connected amateur radio operators in and surrounding Tennessee

Send a message with a body of "HELP" to get help from the list server. Also, Internet users may now INTERACTIVELY work with the ListServ there by:

```
telnet knuth.mtsu.edu 372

    or

telnet 161.45.1.1 372
```

For all lists at ucsd.edu, archives may be found via anonymous FTP at ucsd.edu. Some listserv groups also have archives. Send the command 'help' to the group's listserv for more information. Digest mailings for the ucsd.edu discussions are also available. Send mail to listserv@ucsd.edu with the first line being 'longindex' for more information.

Terry Stader (KA8SCP) <tstader@aol.com> maintains a list of Mac packet-related software, and posts it periodically (somewhat less often than monthly) to rec.radio.amateur.packet.

2.2 What anonymous FTP sites are available for getting packet radio

information and programs?

This is a sampling of FTP sites that carry amateur packet radio related files. Consult the Archie archive server for info on locating particular files. For more information on using archie, send mail to archie@cs.mcgill.edu with the line 'help'.

ucsd.edu

Primary distribution site of KA9Q's derived TCP/IP packages. Also, general packet radio information in the /hamradio/packet subdirectory.

wsmr-simtel20.army.mil

Very large collection of amateur radio software.

wuarchive.wustl.edu

Mirror site of Simtel20 archives. Unix directory structure, which is easier to use then the simtel20 archive.

ftp.cs.buffalo.edu

Supplimental archive site for amateur radio information. Contains current copies of all rec.radio.amatuer.* FAQ's.

tomcat.gsfc.nasa.gov

Packet software including Baycomm, ROSE, G8BPQ, NOS, etc.

akutaktak.andrew.cmu.edu

SoftKiss for the Mac, in /aw0g. Requires NET/Mac.
SoftKiss is an init/cdev/driver that allows a MAC to do packet using a Poor Man's Packet modem.

sumex-aim.stanford.edu

NET/Mac is the port of KA9Q's NET program. It doesn't have nifty features like scrolling or saving the windows, but the individual sessions can be recorded into a file.

2.3 How do I contact the ARRL via electronic mail?

There are various addresses at ARRL HQ, but the most important one is probably info@arrl.org. That is where general information about the ARRL can be acquired. This address reaches a person, so you'll have to specify what/who you're looking for.

2.4 Are there any gateways for mail or news between Internet and Amateur Packet radio?

Internet / Packet Radio BBS Gateway

Jim Durham, W2XO, maintains a gateway between Internet and the Packet radio BBS system.

To mail from Internet to Packet:

1. Mail to: "bbs@w2xo.pgh.pa.us"

2. Make the first line of the text a Packet BBS "send" command, ie: SP TOCALL @ BBSCALL.ROUTING-HINTS < FROMCALL

3. The "subject" line of the Internet mail becomes the "title" line of the Packet BBS mail.

NOTE: Because of FCC regulations, Jim must hand filter each message sent FROM Internet TO the Amateur Packet Radio BBS system. Messages should be of minimal length and appropriate content. Read Section 1.9 (Do's and Don'ts: Rules and Regulations) regarding appropriate usage of packet radio for more information. Always include the routing hints with the BBS callsign.

To mail from Packet to Internet:

1. The amateur radio operator must have his callsign registered in the gateway alias list. If you want to mail from packet to a specific amateur on Internet, send mail to 'durham@w2xo.pgh.pa.us' (Internet) or 'W2XO @ W2XO.#WPA.PA.USA.NOAM' (Packet BBS mail) with his/her amateur callsign and their Internet address.

2. Once the above is accomplished, packet BBS mail should be sent to 'CALL @ W2XO.#WPA.PA.USA.NOAM'. The mail will automatically be forwarded to the Internet address of the amateur with the 'CALL' callsign.

Jim Durham's Internet address is 'durham@w2xo.pgh.pa.us'.

LAN Gateways (Packet wormholes via Internet)

Currently a group of amateurs are experimenting with connecting packet LANs together via Internet IP inside IP Encapsulation. Some of the gateways only accept TCP/IP packets, others AX.25 packets. These gateways uses the Internet as a transport medium, thus it is impossible to access the packet radio network from Internet. For more information, join the Gateways mailing list by sending mail to "gateways-request@uhm.ampr.org".

3 Networking and special packet protocols

This is a sample of some of the more popular networking schemes

available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.

3.1 Are there any other protocols in use other than AX.25?

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.

Often, special packet radio protocols are encapsulated within AX.25 packet frames. This is done to insure compliance with regulations requiring packet radio transmissions to be in the form of AX.25. However, details of AX.25 encapsulation rules vary from country to country.

3.2 What is TCP/IP?

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different computers such as the Amiga, Macintosh, Unix, and others. Smaller computers like the Commodore 64 and the Timex-Sinclar do not currently have version of NOS available.

3.3 Networking Schemes

What are some of those other networking schemes?

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network schemes where created.

Digipeaters

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if its call was in the digipeater field, would resend the packet. Digipeaters allow the extension of range of a transmitter by retransmitting any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.

KA-Nodes

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgement, KA-Nodes allow for more reliable connections with fewer timeouts, because acknowledgments are only carried on one link. KA-Nodes therefore are more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.

NET/ROM

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM station as if connecting to any other packet station. From there, he can issue commands to instruct the station to connect to another user locally or connect to another NET/ROM station. This connect, then connect again, means that to a user's TNC, you are connected to a local station only and its transmissions do not have to be digipeated over the entire network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM doesn't use all of the AX.25 protocol. Instead, it uses special AX.25 packets called Unnumbered Information (UI) packets and then puts its own special protocol on top of AX.25. This is again used to increase efficiency of its transmissions.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, MSYS, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network. However, if band conditions such as ducting occur, ordinarily unreachable nodes can be entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route to a distant node manually defining each hop instead of using the automatic routing feature.

ROSE

ROSE is another networking protocol derived from X.25. Each ROSE node has a static list of the nodes it can reach. For a user to use a ROSE switch, he issues a connect with the destination station and in the digipeater field places the call of the local rose switch and the distant rose switch the destination station can hear. Other then that, the network is completely transparent to the user.

ROSE's use of static routing tables ensures that ROSE nodes don't attempt to route packets through links that aren't reliably reachable, as NET/ROM nodes often do. However, ROSE suffers from the inability to automatically update its routing tables as new nodes come online. The operators must manually update the routing tables, which is why ROSE networks require more maintainance.

3.4 BBS message transfer

Many of the BBS programs used in packet radio allow for mail and bulletins to be transferred over the packet radio network. The BBSes use a special forwarding protocol developed originally by Hank Oredsen, W0RLI.

Besides full service BBSes, many TNC makers have developed Personal BBS software to allow full service BBSes to forward mail directly to the amateur's TNC. This allows operators to receive packet mail at night and avoid tying up the network during busy hours.

Too paranoid. All you have to do is make reasonable attempts to prevent
abuse, not try to stop up every possible chink in the system.

People abuse the Packet BBS network as well. Both by "bootleggers" and by
unthinking (charitable term) users.

The best way to do something is to do it. Don't try to second guess every-
thing or you'll never get it going.

Quite a while ago when I first started Internetting someone told
me that there were "live" Internet/Packet gateways from the Internet
side where licensed amateurs could get an account on the system and
then telnet into a packet BBS, perhaps on the other side of the planet,
and call CQ on the 2m side or whatever the freq is on the other end.

Anyone know the telnet addresses of these systems?

        Thanks!
               John

Hello All,
     The Latest version of XPCOM is on the HAM-SERVER @ GRAFEX....

Some of the features include: Pactor/Amtor/RTTY/CW and of Course Packet

     There is heavy support for the AEA product line and as well as the
     MFJ-1278 TNC....Not to mention your standard TNC's such as KAM and
     TNC2 Clones, such as the TAPR kit, and MFJ-1270 and 1274's

At the flick of a switch you can join all your connected stations together
for a real-time roundtable discussion, with headers letting you know who
is doing the typing...

WINDOWS 3.0 and Above Support....On Screen Help and Graphics as well as
MOUSE support...Com port speeds up to 19,200 baud....

XPCOM is written by Gary Johnson, KF7XP in Mesa, Arizona...
Gary is a pesonal friend of mine, and I couldn't resist putting the software
out for all on the internet to try out...

The XPCOM software can be found at the HAM-SERVER@GRAFEX.CUPERTINO.CA.US

The file is called: XPCOM131.ZIP
and is located in: /HAMRADIO/PACKET/

After you make your request, the file will be sent to you UUENCODED...
You need to have the latest version of PKUNZIP which is now up to ' G ' I
believe...

Gary Can be reached at: GJOHNSON@AZNET.STAT.COM

Enjoy...Please feel free to comment to Gary and let him know what ya think!

To get XPCOM, send email to HAM-server@GRAFex.Cupertino.CA.US
In the text, place:

GET /HAMRADIO/PACKET/XPCOM131.ZIP

If you have not done so, I suggest you also get the HELP file. This can
be done by placing HELP on a single line in the message.

>After you make your request, the file will be sent to you UUENCODED...

If you do not have UUDECODE, see the HELP file for information.

>You need to have the latest version of PKUNZIP which is now up to ' G ' I
>believe...

The latest version of PKUNZIP is not backwards compatible. To be on the
safe side, order both if you do not have them.

GET /HAMRADIO/UTILITY/PKUNZIP.EXE
GET /HAMRADIO/UTILITY/PKUNZIP2.EXE

All file requests can be put into a single message.

Sorry, but Ian's book is not available from TAPR. It is available from
CAPRA (Chicago Area Packet Radio Association), however.

Oops! Sorry about that, everyone. Someone here on the net had
reported that TAPR was selling it at Dayton, so I assumed they
still were. Maybe the original report about Dayton wasn't
even right...

I'm sure about the ARRL, though; I saw it in the May _QST_.
And, as Bob points out, CAPRA sells it, too.

Patty

You get into the issue of why bother. If a non-ham has a burning desire to
get into the amateur bands there are far easier ways then trying to circumvent
the authentication on my gateway. The real reason for having users register
in advance is purely so I know what callsign to use on the packet side of
things. I do check them in the callbook when they register.

I currently have over 500 people using my gateway. They use it to send and
receive packet mail, run the bbs, etc. The bbs has been in operation for about
3 years and in that time I have only had a single incident of outright,
intentional, illegal behavior. Considering that I currently have over 1000
users on my bbs, probably close to 2500 in the last 3 years, this represents
is a very, very, very small percentage.

My method also allows me to have a seemless interface between the two worlds.
Internet only users look to the packet world to be packet users on my bbs.
The sender has no idea his message is destined for another network. Conversely
from the internet side it is just as simple. The user doesn't have to
embed any addresses or keywords in the message body, there is one exception,
when sending messages to non-registered internet users. I find that the
simpler approach is much less error prone and thus requires less sysop
intervention to fix mistakes.

I find that assuming a ham is a good apple until he proves me wrong is the
best approach. It is the only approach in my case, I get far too many messages

through the gateway to read them all.

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
    a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
    No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
    packet radio: WB7TPY@WB7TPY.AZ.USA.NA   -or-
    Internet   : david@stat.com   -or-
    Fidonet   : David Dodell @ 1:114/15

(5) Have fun. Use the gateway as much as you like. That is what it is
    there for.

From Internet to Packet

Send mail to the internet address of:

gate@wb7tpy.ampr.org

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

In Packet-Radio-Digest 128/93, G7KSG told about problems to run
BayCom under Windows 3.1.
BayCom has never been designed to run under windows and because of
real-time-problems it is completely impossible to run BayCom with the
RS-232-modem under windows without problems (sometimes successful operation
was reported to us, but we could never proof it. On most machines it will
not work).
Nevertheless, it is possible to run BayCom together with the USCC-card
(either 4-port USCC or 9k6-USCC with transceiver) under windows.

To do this, start the L2-driver BEFORE starting windows, then call the
SCC-terminal as a DOS-application. This should work in most cases, but
sometimes may cause problems, too (e.g. on slow computers).

I have recently aquired a Sanyo MBC 555 personal computer. It is from 1982 with
an 8086 processor. What I want to do is connect my Kamtronics KPC-3 to it (and
get it off of my 486). However, it has not external serial port. It has a LPT
port and I wonder if I can use this port for data connections. If not, does
anyone else know of how to access this machine for packet.

Please reply via e-mail or packet as I don't often get time to read this forum.

Thanks,
eric

Hi!
I have some problem with TNC:s running with check flag on.
My own software do not like to kommunikate with them.
When a "check" frame is recived i dont know how to handle.
It is a supervisory frame, and i must send an ACK to a supervisory
frame, BUT how do i know that it is a "check" frame and not
a simple ACK ? IS it the FINAL/POLL flag or what ?
Is look like the FINAL/POLL is set to ONE all the time, is that
correkt ?

This is a very simple question, but I couldn't find the answer in the FAQ.

- Can I use a hand-help 2 mtrs. transceiver for packet?

- Do all 144 Mhz ht's have the proper connector for the TNC?

Thanks in advance

>- Can I use a hand-help 2 mtrs. transceiver for packet?

Yes, many people do it all the time including myself.

>- Do all 144 Mhz ht's have the proper connector for the TNC?

Well few if any radios have a connector already for the TNC. In general
you have to make up a cable that is specific for your TNC and radio. Most
TNCs need to make a connection to the radio's microphone jack, speaker
jack, and PTT (Push To Talk) jack. Most HTs have jacks for microphone,
speaker, and PTT to allow the use of a speaker-mic. In some cases PTT is

actually piggy backed on the microphone jack and a capacitor and resistor
are needed to make the rig key up properly.

In any event, your TNC should have instructions with it that describe how
to make up a cable suitable for a number of different rigs. If you can't
figure it out from the manuals, post the information here and I'm sure
someone can help you.

Good luck!

THE POOP ON BNC FEEDTHRU ADAPTERS

Thanks for all of the responses to my search for BNC feedthrus.
I've got information and some neat suggestions to summarize:

1) BNC feedthrus *are* available, but they are in such low demand that
manufacturers (Amphenol, ...) charge $40 each for them. (Sounds like
market theory, right? :-)

2) Pasternack Enterprises of Irvine, CA *does* sell them for $10 each
with a $100 minimum order... so some enterprising hams might order 20
or so and head off to their next hamfest and try to sell them for $15
or something. (Market them at packeteers, students, and HT mobile users.)

3) Clever ideas:

  a) a combination BNC double jack/double plug

    advantages: cheap $3 each
    disadvantages: about an inch longer than a feedthru would be...
              a longer lever arm for damaging your HT antenna
              jack should it make an unscheduled trip to the ground

  b) a combination of two BNC right-angles   ***

    advantages: cheap $3 each, allows you to turn the antenna up for
              operation and down to the *side* of the HT for
              storing in your backpack, etc. (Yes! they swivel)

    disadvantage: adds a bit of horizontal dimension to the HT

  c) other combination adapters

    BNC to RCA phono, etc. ... depend on the availability of matching
    antenna plugs

  d) request one or two from the manufacturer as samples

    (I haven't tried this, but it is a pretty common thing in the
    electronics industry, I guess.)

>it is available for FTP from ucsd.edu. I am using a FTPMAILSERVER to
>request it and expect it will arrive in the next few days.

It seems kind of silly to update your own message, but then maybe not.

I tried the mailserver but was unable to get the files. The report said that
they were not found. So I requested a list of the file area. They are there
in ucsd.edu within the directory hamradio/packet/tcpip/incoming.

There are actually three files available for FTP. They are called:

pe1chl-930411.tar
pe1chl-930411.txt
pe1chl-930430tc.arc

I hope that helps those that are experimenting with ka9q nos on the Atari
computer platforms. 73 Terry

GEOMAGNETIC MEASUREMENTS

Does anybody know if there is an accessible service that provides
information on geomagnetic conditions on a daily basis? In particular
I am looking for K-index measurements. Is there any advanced 'weather
forecast' for geomagnetic disturbances, or does anyone have any
software to predict future disturbances (geomagnetic storms often recur in
with similar characteristics 28 days later due to the 28-day rotation
of the sun and the sunspots on its surface)?

Preferably this service would be accessible by modem and PC.

Many thanks,

Joe Olmi
Birmingham, UK.

This does not work all that well. There is quite a bit of reflection
back into the receiver. I stopped using it fearing it might damage the
front end.

Would you care to elaborate on this? How is it that BNC right angles cause such
reflections? How was this measured? Do other right angle adapters introduce such
trouble?

Many locals do use the dual right angle approach to attaching their rubber
duckies, and even more of us use BNC, N, and UHF right angles in our antenna
systems. If there is a problem with using these devices, I'd be REAL interested
to hear about it...

Would the following type of review and forecast be of use? It is provided on a
daily basis directly from GSC via dial-up modem and is also posted to the
e-mail based Canadian Space Geodesy Forum (CANSPACE). E-mail me for info on
CANSPACE.

To anybody who asked me, I lost a lot of the requests when my mail file disappeared.
Here's the info from the October '92 73 Amateur Radio Today magazine that had the
article on the Mac Packet Modem, a TNC-less circuit to do packet just like the Poor
Man's Packet for IBM-type computers, but for the Apple Macintosh computer.

"A complete kit of parts including the PC board is available for $30 from the
author at
     Sigma Design Associates
     Attn: Dexter Francis
     22150 Berkeley Court
     Los Altos, CA 94024
An etched and drilled PC board is available for $3.50 + $1.50 shipping per order from
     FAR circuits
     18N640 Field Court
     Dundee, IL 60118
To obtain a disk containg SoftKiss and NET/Mac, including the Hypercard stack, you can
send a blank 3.5" diskette along with an SASE to the author. The author can also be
reached at CompuServe: 70611, 1340 or Internet at Francis4@Apple.com."

Myself and other have had no luck with the internet address. An FTP site for SoftKiss
is at akutaktak.andrew.cmu.edu [128.2.35.1] in the /aw0g directory.

Good luck!

Hello all:

I need to connect a Tiny-2 TNC running TheNet 2.08 to another TheNet node
via
the serial ports. I know that in a MFJ 1270B TNC you need to connect a
wire
from jumper 9 to pin 23, then another wire from pin 23 to pin 10 in order
for
the TNC to talk Xlink thru the serial port. Since the layout of the
Tiny-2
is so different, I don't know where to start!

Quick help is appreciated, as I need to get this thing running this
weekend :-)

73, jan

Summary: Clarification on sending mail to AppleLink addresses

In article <C6yyry.AME@avalon.nwc.navy.mil> Jan A. Barglowski
<jan@archimedes.chinalake.navy.mil> writes:
> The author can also be
>reached at CompuServe: 70611,1340 or Internet at Francis4@Apple.com."
>
>Myself and other have had no luck with the internet address.

That's because it's wrong. If _73_ wrote it like this, shame
on them.

All messages to AppleLink accounts need to go to "applelink.apple.com".
So Dexter's address would be "francis4@applelink.apple.com".

By the way, there's a 50-cent charge (to the AppleLink account owner)
for messages going through the AppleLink/Internet gateway, so out
of courtesy to those folks, please don't send a message that way
unless you really have to.

Some of my fellow hams are putting up some 9600 baud radio links for

TCP/IP using 440. I would very much like to join in on the fun and I
was hoping some of the packet mavens here could tell me what the best
9600 baud packet modems are for the money. Also I would like to access
some of the microsats in the future also. Thanks for any and all help!
73!

Just wanted to mention that Savant, the packet radio software mentioned in the
article, is also available now! Savant is an AX.25 packet radio communications
program written for the Mac. It features a multi-window, multi-connection
interface, and follows the standard Mac user interface at all times.

Stan Horzepa recently did a mini-review of Savant in his Packet Perspectives
column in the May 1993 issue of QST. He gave it a GREAT review!

Let me know if you want more information

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to

read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
 - What is the purpose of rec.radio.info?
 - Why are messages almost always cross posted to rec.radio.info?
 - What is a 'follow-up', and what does 'moderated' mean?
 - OK, so now I know what 'moderated' means. Tell me more.
 - What type of material is considered inappropriate?
 - I do not have access to news, how can I get the information posted to
   rec.radio.info?
 - Will the material appearing in rec.radio.info be archived somewhere?
 - I have a regular posting with timely information, is there a way to
   speed up it's delivery, or automate for more convenience?

 -- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit chat about radio. Rec.radio.info will contain informational, factual articles only. Follow-ups are redirected to an appropriate other group, and further discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it was decided to create the group as a moderated newsgroup.

 -- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered presentation in rec.radio.info (even with cross-posting, only one message, with a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:

```
/Newsgroups:.*[ ,]rec\.radio\.info/h:j
```

either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:

```
rec.radio.info:!s/:^
```

in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:

```
sequence
rec.radio.info
rec.radio.
```

at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:

rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

   rec.radio.swap may be more deserving of the posting in any matter.

   Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

```
sub address radio-info
unsub address radio-info
```

where 'address' is your full mailing address. Send this request to

```
     listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail.
If you leave the address portion blank, it will try to deduce your address
from the mail headers. This may not work if you are on bitnet, milnet or
some other non-Unix host, so it is recommended to put your return address
in any case. For example:

     sub mymailbox@myhost.mydomain.mil radio-info
or
     sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

 -- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
     - unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
     - nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
          saved to /pub/dx/text/rec.radio.info currently stored as
          numbered files.

Effectively this means that anything you post to rec.radio.info will be
permanently stored, so your work will not be lost.

 -- I have a regular posting with timely information, is there a way to
    speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are
willing to take responsible people and provide them the means of posting the
articles directly from their site. We will try everything we can as we fully
realize that DX (distant signal) and astronomical data can be somewhat
transitory. We are also willing to allow regular posters of information the
same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for
news.answer. This requires co-operation and good will to be beneficial to
the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to
suggestions.

I thank the following individuals for their input into this article:
     rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
     rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
     Paul W. Schleck, KD3FU pschleck@unomaha.edu
     Ian Kluft, KD6EUI ikluft@uts.amdahl.com

I have been using the external mailer PCelm for DOS for my AMPRnet mail.
That has worked quite well. However recently I decided to try to use
PCelm for my UUCP mail. I had some problems adapting PCelm.RC (the
startup file) for use with UUCP. I wonder if anyone else is using PCelm
for thier external mailer with RMAIL? If so, could you please send me
your comments or maybe an email copy of your startup file which is
configured for use as UUCP rather than amatuer radio. Thanks.

Subject: If you didn't get a copy of the CFV...

Message-ID: <330J03xTd2x300@amdahl.uts.amdahl.com>
Date: 17 May 93 05:25:15 GMT
Organization: Amdahl Corporation, Open Systems Development, Santa Clara CA
Lines: 26

I mentioned a couple days ago that I made a mail server for the CFV since a
number of people asked me for copies. I sent out a bunch of them manually
and then set up this server. Well... it worked fine when I tested it. :-(
There was a setup error that resulted in this output for everyone but me:

>--copy of CFV---
>[the mailer script was not able to open this file]
>---

Needless to say, that isn't even an abridged version of it! I've fixed the
error. (The directory permissions were accidentally set so it would only work
if *I* sent mail to it. I hate it when that happens!)

It will work now. If you want a copy of the CFV, as posted by the moderator
of news.announce.newgroups, send mail to

     cfv-request@uts.amdahl.com

The script won't read your mail. It will just look at the reply address and
send you a complete copy of the CFV.

My sincere apologies to anyone who sent requests and got the error back!

We don't normally use right-angles in the lab, but I just happened
to have two of them at home (bit grungy looking but high quality silver
plated connectors).

Anyway, below 700 MHz, the return loss is better than 20 dB. Or,
more commonly stated, the SWR is below 1.2:1. In my experience, this
is better than the performance of crimp type BNC connectors. (Higher
frequencies weren't looked at).

Thus, I don't see anything inherantly wrong with right angle BNC
adapters. Though there are some *cheap* adapters and connectors
I probably wouldn't use if they were free.

A front end that is damaged by a poor passive termination is an
extremely bad design. Actually, I'd like to see more *transmitters*
that are immune to poor terminations. After all, forgetting to attach
an antenna or having an antenna break isn't exactly a rare event.
Power FETs seem to do pretty well in this regard, particularly with
well designed power supplies.   .

Subject: IC 229H - IF CHIP TK10487M and 9.6 Kb Packet
Message-ID: <seeler.16.737645464@UPEI.CA>
Keywords: Packet IC 229H TK10487M
Sender: news@jupiter.sun.csd.unb.ca
Organization: University of Prince Edward Island, CANADA
Date: Mon, 17 May 1993 13:31:04 GMT
Lines: 49

I would like to thank all those who provided suggestions with regards to the
use of the IC229H for 9.6 Bb packet. I have had some excellent suggestions
and while I have yet to try them out personally _ I would forward the info
to those who would like to evaluate/try it.

With regards to FM detection in the IC229H - the radio uses the TK10487M
chip from Toko America. Their easter office was kind enough to forward
to me the pin out information for this chip. The chip funtions as a
Narrow Band FM IF System for cordless phones and Amateur Radio Receivers.
It contains a mixer, oscillator, IF AMP, Filter Amp, Squelch related
amp and the FM Detector (QUAD DET).

The PIN OUT INFORMATION for this chip (TK10487M) is as follows:

PIN #	DESCRIPTION
1	Oscillator (B)
2	Oscillator (E)
3	No Connection
4	MIXER OUT
5	Vcc
6	IF INPUT
7	Decoupling (IF AMP)
8	Decoupling (IF AMP)
9	Phase Shift
10	QUAD COIL
11	AF OUTPUT !!!!
12	S Meter Output
13	Filter Amp Input
14	Filter AMP Output
15	Squelch Input
16	Scan Control
17	Scan Control
18	Hysteresis Control
19	GRND
20	RE Input

I hope that this information may be of value to those who have FM rigs which use this chip in the IF and detector stages. This information was taken off the pin assignment/block diagram of the chip as supplied by TOKO AMERICA. I have yet to try it out in my IC229H - as always - mods are at your own risk.

Lines: 39

People are confusing the bowtie filter with the X display
that appeared in the spring issue of Communications Quarterly.
It was also mentioned in the October 1965 issue of QST.

The X display is a filter circuit that drives an X/Y
oscilloscope for accurate tuning of FSK signals. The new
version (in CQ) uses a solid state op-amp Gyrator circuit.

The bowtie filter is a circuit that uses the tone filters in
the TU or TNC to obtain an accurate display. It also corrects
other problems such as mark/space channel separation and the
phase tilt that distorts the crossed ellips or "footballs".

It actually increases the discriminator output and provides the
bowtie display down to 10 Hz shift.   When the receiver is tuned
to a carrier in SSB mode, you can adjust the hetrodyne to the mark
tone. The bowtie will display a - or a horizontal line. When you
tune from a mark to a space the line changes from horizontal to
a diagonal \ to a vertical | line. In fact, if you can set your
TNC to 30 Hz shift, as your receiver tunes in 10 Hz shifts, you
would see the bowtie change in 3 evenly spaced angles from 135 to
150 to 165 to 180 degrees.

The bowtie works great with H.F. packet. You can precisely tune the

filters dead center on the mark and space frequency. I found that
this is an advantage. If any tone filter are mistuned by as much
as 20 Hz the error rate increases. The bowtie filter is available
for the Universal M7000 and M8000 and plans are in the works for
PK232 and KAM add on boards.

I would like to know if anyone is using a Kam on a Mac.

I currently use Mac-Kermit, and it works fine. However, I would like to
have something that sets the date/time whenever I start.

Under DOS, I have a program called tncinit, and it was in a batch file.
tncinit set the date/time for me, then I ran kermit.

Are there any Mac packet programs? I have ftp but I am unsure where to
start looking...

Check out my packet radio program for the Mac called Virtuoso.

The following is a list of some ftp sites where you can find Virtuoso:

ucsd.edu:
     /hamradio/packet/misc

hpcsos.col.hp.com:
     /packet/ke0ph

pacific.mps.ohio-state.edu:
     /public

sics.se:
     /pub

If you still can't find it or can't get it to work, let me know.

At the suggestion of a few netters, I've ckecked my setup over again with
the BNC elbow connector. I still get a very large reflection return when
I use the elbow.

It turns out that the BNC elbow I used was partially shorted to the outer
connector (17 ohms); I found out *after* I took *everything* apart.

Since the BNC was new, it never occured to me the connector could be
defective, and I was looking for opens rather that shorts.

Any one who might know,

I was wondering if anyone has seen a morse code tutor that works
on the HP48 - haven't really checked out the big HP news groups
yet- I will soon- I'll post my findings if I have any luck.
Even a very simple program would be great- I don't really want to
spend the time programming one for myself-

Thanks ahead of time!!-

                          How to Use the WB7TPY
                      Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
    a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
    No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
    packet radio: WB7TPY@WB7TPY.AZ.USA.NA   -or-
    Internet   : david@stat.com   -or-
    Fidonet   : David Dodell @ 1:114/15

(5) Have fun. Use the gateway as much as you like. That is what it is
    there for.

From Internet to Packet

Send mail to the internet address of:

gate@wb7tpy.ampr.org

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@stat.com

      Internet: david@stat.com   FAX: +1 (602) 451-6135
      Bitnet: ATW1H@ASUACAD   FidoNet=> 1:114/15

Kantronics also makes a version of Hostmaster for the Mac (called, oddly enough,
Hostmaster Mac).  I've been using it on my Powerbook 160 with a KPC-3 to great
success....

Hi,

I would like to find out a bit more about packet radio. At this moment I don't know anything about it. I have been following this news group for a long wile now but still dont know how these gizmos fit together. What does an absolute beginer need to do packet radio besides a computer? What are TNC's ? Where does the modems come in? How much does the modems, TNC's and radios cost? How fast is packet radio - could you get 9600 buad with it? What are the ranges - would a mountain be a big problem ?

These questions must be really frustrating to you guys (or girls) but I would REALLY appreciate it a lot if someone could throw me in the right direction. A tutor could help a lot. I have access to the internet so FTP-sites wouldn't be a problem.

Please reply via E-MAIL if possible.

Thanks in advance,

Christo Struwig

Hello Fellow Packet Users,

I stumbled upon a new Wormhole, (at least it's new to me), New York to Moscow. I'm not sure how the transmission is made.
(the New York - London wormhole is via the NBC satellite)

In New York city, connect to node: "NYHUB", the ports are as follows:
Port 1: Roof Link
Port 2: London
Port 3: Moscow

Presently the only node in Moscow is "RARES:RW3AH-1"
(RARES stands for Russian Amateur Radio Emergency Service) There are only ten or twelve Packet Ham Radio operators in the Moscow area. I spoke to RW3AH, Andy. He was very pleasant to talk with. He gave me the callsigns of some of his fellow Ham Radio operators:

Local frequency: 144.650 MHz
UA3ABH, UA3ABH-1 (KAM PBBS)
RW3DR
RV3AA
UA3AMB, UA3AMB-1 (KAM PBBS)
RW3AH (Andy), RW3AH-1 (Node), RW3AH-2 (KAM PBBS)
UA3ATQ, UA3ATQ-1 (WNOS PBBS)
UA6HZ
R3ARES (Only BBS)
RA3AT-15

If you are within a few nodes of New York, give NYHUB and RW3AH-1 a try.

Lets here about other wormholes. If anyone knows of others, please post the location and how to use it.

I'm interested in how packet works in your area. Here in southern
New Hampshire, we have a number of TheNet/NetROM nodes, a DX cluster,
and several BBSes. I haven't seen much PacTOR, ROSE, KA-Node, etc.
activity. Most of the messages on the local BBSes are addressed to
FOO @ USBBS, i.e. national bulletins/for sales ads, rather than local.

I almost never see anyone calling CQ.

What would a complete packet neophyte need to know to get started in
your area?

What services are available (callbook lookup, weather, etc.) in your
area and how do you access them?

Do most of the packeteers in your area use packet to 2-way QSOs, or
do you rely on Personal Message Systems and BBS messages to contact
fellow hams?

What "enhanced" digipeating systems are in use in your area (NetROM,
ROSE, TexNet, etc.)?

I have seen lots of information in print about how to put a packet
station on the air, but I haven't seen much about what to do once
you *do* get on the air. I have heard complaints that there don't
seem to be any "Packet Elmers" out there, so most newbies just have

to stumble around until they happen to find out what they're doing
by accident. I would like to write something to tell packet newcomers
what to do once they get on the air. I want to explain how to use
a BBS, how DX clusters work, how to send messages to people in far
away places, etc. You know, all of the stuff that you do every day.

Please let me know how things work in your area, so that I can make
this as general and all-encompassing as possible.

Hi all...

    I'm very interested in getting into Packet Radio (my university has
a gateway into it's LAN through packet, and there have been times that I've
really needed the LAN, only to be unable to reach it!)

    Anyways, I need to know a couple of things:

    a) Is there any packet software out there for the MAC? If so,
        does someone have an FTP where I can get it from?

    b) Is there something like Poor Man's Packet, where the software
        emulates a TNC? I have heard that there is a similar program
        available for the Mac...

    c) Radio Equipment: What is the basic set I will need to set up
        my system? I'm looking for something small, as I have a
        Powerbook... Can anyone recommend any brands & pricing?

(This also includes TNCs)... I don't need a LOT of bells and
whistles (some would be nice though!)... and have a maximum of
about $500 to spend... well, not even that! :-)

I'd appreciate it if you could get back to me here, or mail me
direct on the Internet at "dknight@physics.watstar.uwaterloo.ca"...

Hi all,

  I was wondering if anyone knows of any good packet software to run an
Apple IIgs. I have a program that works ok, but I was looking for something
made specifically for packet use. It would be nice if it had some sort of
BBS program included. Any help on FTP sites or the like would be greatly
appreciated.

I shall coming over to the Philadelphia area for a holiday in the middle
of June and would like to purchase some Kantronics equipment.
Can anybody provide me with an address and/or telephone number of a
supplier, preferably in the Philadelphia area, but if not someone who
could ship the items to me during my stay. I shall be there just over 14
days.

Many thanks......

Richard

Hi.

I left a previous message about the BNC antenna connector
on my HT wearing out (from too much use! switching antennas
for mobile and packet operation. the locking nubs were
worn about 40% through after two years, 9 months of heavy
wear).

Several people have recommended getting a "male-to-female"
BNC adapter which I understand is also called a
"bullet" or "feedthru".

So far, I have only been able to find one source for such
a thing: Pasternack Enterprises of Irvine, California.
Pasternack wants $10 each with a $100 minimum order.
Surely somebody can point me to a less expensive source!?
(I've already checked Radadidio Shack and a local electronics
store. HRO was suggested, but they don't have one either.)

Please email me some suggestions!
(I am using two linked barrels right now, but that adds
about an inch of unnecessary height (and "damage lever")
to the connector.)

Thanks.

I am interested in obtaining information about VITA (Volunteers in Technical
Assistance?) and their use of LEO satellites. I understand they have some
sort of packet mail forwarding system located on one of the amateur
satellites. I need to know what bird it's located on, frequencies, protocols,
etc. Any information at all would be appreciated. Thanks.

Ian if you find it I would be interested in a copy. I have 921018TC/TP
which means I have both the GEM version which provides 14 interconnected
ports running as nodes for linking multiple HF/VHF/UHF/SAT/LLBBS ports.

I also have the command line interpreter version which acts more like the
MS DOS KA9Q TCP/IP software. I would like to have the latest version.

If you care to you can call Ben's Place 405 536-6988 and download all the
amateur radio Atari software I have. The system is operational nightly
from 9 PM to 7 AM. Ben' Place is the official support BBS for the Atari
Micro-computer network which meets on 20 meters at 1600 UTC on 14.325 Mhz
each Sunday morning. Ben's Place is also the official support BBS for
FLAG, the First Lawton Atari Users Group, here in Lawton, Oklahoma.

If I can be of any further help, just let me know. Regards, Terry

Hello All,

Does anyone know if there is a freely distributable packet bbs package
for UNIX (System V R4, i386 -- I'll settle for R3 and port if needed)?
If so, how good is it, can it foward between packet and uucp, and where
can I get the source? Any help would be appreciated. Please reply to:

          ras@rasorl.oau.org

Thanks in advance,

Kohjin

This is really exciting. How can I get these files from ucsd.edu? i have
the older version of pe1chl but would like to have the latest. I also
maintain a LLBBS for Atari amateur radio software and maintain a complete
set of pe1chl tcp/ip programs for the Atari on my BBS.

Finally, I need a copy of the schematic for building the midi port/comports
for connecting to several different modems. Could you tell me how to
get a copy of it or better yet, how I might buy one already assembled?
Thanks for the help. regards, Terry

I am interested in commerical packet radio or wireless lans. In particular
I am interested in the 900mhz SS units. My goal is to feed a small number
of sites internet mail and usenet news so I can't use ham radio
(especially if I feed alt.sex.* :-) I need to span between 1 and
10 kilometers at speeds up to 19.2k. I know I can just use v32bis
over phone lines but I only have one line for 2 humans and a computer
and I am not thrilled at the prospect of phones ringing in the night
or spending 20+$/mo for a second line.

So, any comments on these beasts pro or con would be welcome.

Thanks in advance

Well, I'm about to write my test....and soon after that I plan to break
into
packet. No more listening to BBBBUUURRRUUUPPPSSS....on my scanner (145.01)
or
just listening to the two local repeaters (147.060 & 147.180).

In the meantime, I've been looking for Packet programs for the
Amiga.....and I
haven't found anything yet.

I'm questing for software to drive a Baycom style modem preferrably.

And, cost hiding (so I can live to use it) is kind of a factor here 8-)

I suppose if I absolutely had to, I could settle for a program to drive a
KPC-3 TNC.....I had an offer to get one of these....

I heard that there was a program out there for working packet off of a
Hewlett Packard 48SX calculator, and I was hoping someone could tell me
about it. I believe that the calculator acts as a dum-terminal, and the
purchase of a terminal node controller is emminent- if you have heard

differently, please say so- this is sort of a future project, but would greatly appreciate any info.

Cylink manufactures "Airlink" modems that would be good for this kind of work. The AirLink 128 runs 128 kb/s synchronous, and 38.4 kb/s asynchronous. They claim to work for about 1000 feet with "rubber duckie" antennas, and 10 miles with yagi antennas and a line-of-sight path. The radio system is 900 MHz spread-spectrum, and they cost $3150 per modem. They sell only through distributors, but will give you the distributor's number if you call 408-735-5800.

They also have three other models, from voice-only through 256 kb/s synchronous-only.

Once these things get below $1000, you'll see an explosion in use for FIDOnet and Usenet, as well as tons of in-building use. I wonder how well the spectrum allocation will hold up?

Has anyone else come across a problem scanner that emits a
signal strong enough to key your local repeater? We have one
someplace in the neighbor hood that when it scans across 155.610, it
emits a signal on 144.7859 that keys on the input of the 144.79/145.39
repeater. What corrective actions did you take?

I saw a few requests for this, and thought that I would post instead of e-mail. (ain't technology wunnerful?) Anyway, I downloaded the VT52 emulator off of wuarchive.wustl.edu in the systems/hp/hp48 directory. The program seems to work O.K., but it doesn't echo to the screen. It has changeable fonts, so it is a little more useable.

WARNING!

I haven't been able to put it on packet yet, my TNC has a 25 pin connector. I tried using an adaptor to the HP link cable, but in the 21 pins lost (25 to the 9 pin, and 9 to the 4 pin of the HP), I lost all of the software flow control (XON/XOFF, etc.). I now need to get an unterminated cable, and dig up the pinouts to figure it out. So the moral of the story is: IF YOUR TNC HAS 25 PIN I/O, YOU WILL NEED TO BUILD YOUR OWN CABLE!

You may like this possibility or not, so take it or leave it... It's
not a radio solution...

There is a box available to intelligently share your phone line. It
has 5 ports: incoming line and 4 outputs: phone(s), answering machine,
fax, modem.

It's completely programmable (from a touch tone phone) and if the
calling modem is set up right, the phones don't ring on a fax or modem
call. It has security access codes for the fax and modem ports. I
have one and like it a lot. It can be wired for exclusion so that if
someone picks up the phone it doesn't disturb a fax or data transmission.

Anyway, if you are interested, email me and I can tell you where to
find one.

73, Seth

This is really hillarious. The original message said he couldn't afford $20 a
month for an additional phone line so he gets a suggestion that cost more than
$6000 per shot.

Nice to see people here still have a sense of humor.

 True, but doesn't it depend on everyone being on the same side of the step
 down transformer out on the pole. I remember several years ago you could
 buy intercoms that worked on that principal.

A FAX modem switch could be a better alternative, a good one is
available from Sam's Club. Your phone won't ring unless it's a voice
call.

We've been playing with some NCR Wavelan cards. They claim a range
of a few hundred feet with the included antenna, and a range of 2-3
miles with an optional yagi and amp. We're using a loop yagi on one
end of the 1.8 mile path and a 4 foot dish on the other (it's what was
handy). They work, but you must have a true line of sight path. If you
can't see the other antenna, you're not going to have a good BER. This
is really disappointing performance by ordinary amateur RF standards,
the cards need at least a -85 dbm signal for a decent BER, and multipath
really causes problems. At the price of these units, and with the rather
modest performance they offer, I'd say put in the second phone line.

Other cards, with more robust SS implementations, shouldn't be bothered
by multipath, but you still need that line of sight path because the
attenuation of foliage, not to mention hills, at 900 MHz is enough to
knock the signal strength down too much. These things can't run more
than 1 watt to fall under Part 15 rules, though the manufacturers are
offering higher power amps without telling you that using them is
illegal without special licensing.

In many urban areas the 900 MHz band is filled with thousands of
these things running in offices, thousands of VCR Rabbits sending
TV signals, vehicle locator systems, hams, and anti-shoplifting
systems, as well as some old ISM equipment drying plywood. It's
rapidly becoming like class D CB with everyone boosting power
trying to make shorter and shorter hauls.

Gary

Hello!

  Pardon me if this is a FAQ, but I wasn't able to find any information on the subject recently...

  I will be graduating from college in a year and will really suffer internet-withdraw when I leave. I had thought of plunking down a lot of money on a fast modem and dialing in to one of the public access accounts that are located all over the place. Only problem is that the ammount of time that I am use to being on would make my long distance bill second only to the national debt.... This is where packet radio comes in. I have read a bit about some of the MS-DOS/UNIX programs that allow a rig to receive/send packets to other sites on internet... Now for the questions:

  What would be an inexpensive rig to get setup with? From what I understand, I can take a modem and hook it up to the speaker/mic ports on the radio and tune to the correct frequencys (a bit over simplified I know)... What I would like to do is purchase a fast (14.4 or V.fast) modem this summer and use it this next year. Then, hopefully when I graduate and get some sort of job I could purchase a radio and tap into the net that way. Is this basically what is done, or is this way off also? What would the range of this rig be on an average day (broadcasting)? (Yup, this is a newbie... :))

  What about licensing? The FCC has the non-codeing ticket, is that enough? M-Code is not that hard (think I did a bit with it in cub scouts 10 years ago...)...

  I realise that it takes two to tango, so what about the other end? Are there any sites within the range of the eastern nebraska area that I would be able to feed to/from? Are they normally free, or do they charge a monthly fee? If so, is it prohibitive for a single user? (Later, I might branch out and let local BBS's feed from my system if my wallet ever catches up with my dreams...)

  Are there any magazines that I could pick up at a book store that would be of assistance, and be a good source for a beginner?

  If anyone else wants, I can collect answers and post the collection in

a week or so...

  Thanks in advance!

  Dan Linder

I know it isn't "pure" ham radio, but I need to phone-forward from a
w0rli system to a wg7j-nos system. There has to be someone on the Internet
who is already doing this, and I would really like to avoid re-inventing the
wheel.

Thanks,

How can I get a copy of pe1chl's latest version of tcp/ip for the Atari computer. I currently run 921018TC/TP but am not satisfied with the mail function. BM only lists (info) (bye) (send) in its menu. It maybe that I am not running the whole program suite correctly. So far I have been forced to leave my PK-232MBX mailbox running because the BM features aren't as powerful.

One of the local tcp/ip sites suggested I turn on bcnodes and thought that might help. Any suggestions will be appreciated.

No, I think you have misinterpreted my suggestion. I did say this
wasn't a radio solution. I guess you're thinking this is a "carrier
current" unit, with rf carried on the power line. Nope.

This is a dialup modem solution, without the need for an additional
phone line. Anyway, Gary (who posted the original question) sent me a
note that he was interested, so I'm sending him some more info.

If anyone else is interested, just ask.

73, Seth

I am interested in knowing if anyone has the PIN OUT information to the
TK10487M chip which is used in the IF stage of the IC229H to provide
IF Amplification, Mixer, Oscillator, and FM Detection. In particular,
I would like to know which PIN carries the DETECTOR OUTPUT in order that
I can modify the rig for 9.6 Kb packet operation. The company - Toko America
did promise to send the chip info out a while back - but it has yet to

arrive.

Any help would be appreciated. My previous post in regards to IC229H mods
for 9.6 Kb packet generated no replies - so anyinformation I am able to
generate will be posted here in the event others may wish to use the
rig for medium speed packet.

Thankyou for your consideration of this request.

Well, here is the email response you have been looking for....
GRAPES is real small when it comes to modems, it is just a club
project that keeps getting bigger. If you have any questions
about the modem/availability, please drop me a line. I'm the
current President of GRAPES (Sucker/volunteer). I'm also highly
involved in the local LANS. Currently most of the core group of
GRAPES volunteers were at Dayton, and should be returning to their
requlars lives of little or no time to devote to the tasks at hand.

Important Email addresses -

```
     emory!nanovx!dennis    (Dennis Boylan N4ZMZ) (myself)
     emory!wa4mei!ke4zv!gary(Gary Coffman KE4ZV) (prolific on usenet...)
     emory!kd4nc!dug        (Doug Drye KD4NC) (shipping, et al)

Hopefully we can finish up some projects and emailing to us will be
something like -
     modems@grapes.org

But all of this takes time...  Should get to it before the end of the
year...
  Dennis

  The correct address is francis4@applelink.apple.com since it's an
applelink account. Dexter is the designer of the PacketMac modem and
is still selling modems both in kit form and completed form.

CAPRA - the Chicago Area Packet Radio Association has arranged to
obtain a supply of Ian Wade, G3NRW's new TCP/IP primer -
"NOSintro." Reviews of this book have been quite good.

This 356 page book is a hands-on tutorial with documentation
regarding TCP/IP and NOS software version of this international
standard as implemented for use with amateur packet radio
operations.

An earlier posting listed all of the 35 chapters of the book
which outline the basics and more advanced topics of TCP/IP;
there are 6 Appendices with additional reference materials and
information. The book has over 80 detailed diagrams with
"countless examples of commands and screen displays".

The books will be shipped via U.S. Postal Service's 2nd Day
Priority Mail service upon receipt here in suburban Chicago.

Ian Wade, the author, has given us a discount for our quantity
purchase. The cost to you will be slightly under the total cost which
you would have were ordering directly from the publisher in the U.K.

This is NOT a money making undertaking on the part of our group.
Many of us are active on TCP/IP and feel that this is a way to
increase the awareness of and technical expertise of others who
may be interested in or who are currently using the protocol in
amateur radio circles.

Send your complete mailing address, a telephone number at which
you can be reached should there be a problem, and a check/money
order made out to CAPRA in the amount of $22.50. Canadian hams should
send $24.00 in the form of a Canada POST International Money Order
payable in U.S. dollars.

The final date for ordering the book from CAPRA is July 31, 1993.

CAPRA - (Chicago Area Packet Radio Association)

Presents: TCP/IP - Seminar/Workshop

The interest in TCP/IP (Transmission Control Protocol/Internet Protocol) in the radio amateur community has been increasing rapidly in the past year or two. Unlike regular AX.25 packet, TCP/IP is somewhat complex to set up and operate. More than with any new mode, there seem to be many people frustrated in their attempts to get started. As an aid to those interested in TCP/IP, CAPRA will conduct a hands-on, seminar and workshop.

TCP/IP is used extensively in telecommunications networking in government, educational, and corporate organizations. It includes several capabilities including unattended electronic mail exchange, retrieval/forwarding of files of information, software, and other materials to/from several hundred thousand computer systems throughout the world, incorporating hundreds of gigabytes (billions!) - pieces of information of all kinds, and, connectivity which allows authorized users to "operate" computer systems at distant points.

As implemented in the amateur community today, there are gateways to/from the amateur packet networks to the Internet (world-wide computer system networks), as well as to far distant amateur packet radio networks throughout North America, Europe, Australia and other points. Some, but not all of the capabilities of the amateur networks can be used with the AX.25 protocol; however, TCP/IP is "richer" and has greater capabilities to allow one to "reach out" to other amateurs and varied resources through the world as indicated above.

The seminar/workshop will:
- introduce you to the "basics" of TCP/IP
- introduce the amateur radio packet software package -- NOS
- explain the hardware requirements for using TCP/IP
- provide demonstrations via "hands-on" stations for your use at the workshop
- allow you to "prepare" a personalized copy of NOS for installation at your own station QTH
- discuss the backbone network in Metropolitan Chicago including links into the Internet
- answer questions, questions, questions...

When: Saturday, May 15, 1993

8:00 AM - Doors Open
8:30 AM - First Session
12 Noon - Presentation Conclusion
12 Noon - 1:00 PM - Lunch
1:00 PM until ??? - Discussion, Hands On, Prepare NOS Disks, Questions

Where: Harper Community College in Palatine, Illinois
(NW Suburban Chicago) (Algonquin and Roselle Roads)
Building H. Free Parking in Lot C.

Other:

- If you plan on preparing a personalize copy of NOS for your station, bring the appropriate MS-DOS or MAC diskettes (minimum 3, just in case)

Contact: Jim Chesner, N9GBH (708) 253-0046 n9gbh@kb9dip.il or Bob Van Valzah, KE9YQ (708) 690-2282 bob@ke9yq.ampr.org if you have questions.

CAPRA
Post Office Box 8251
Rolling Meadows, Illinois 60008-8251

NOTE: R.S.V.P.

Those wishing "hands on" assistance with equipment must reply; first come - first served.

Hi,
We just finished the "QRZ! Ham Radio CDROM". This disc contains the most recent U.S. Callsign Database, hundreds of shareware programs, Radio MODS, packet radio stuff, Usenet ham radio archives, FCC rules and regulations, exam question pools, Morse code tutorial, Canadian Callsigns, and much more.

Fred Lloyd (email: Fred.Lloyd@west.sun.com, callsign: AA7BQ) is the editor for this this disc. I think he did a really good job putting it all together.

If you want more details about this disc, you can ftp the readme and index from cdrom.com:/pub/cdroms/ham.

The price is $25. S&H is $5 for US/Canada/Mexico, and $10 for overseas. If you live in California, please add sales tax. You can pay by check, money order, Visa/MC/Amex, gold bullion, small unmarked bills, etc.

Bob Bruce
Walnut Creek CDROM
1547 Palos Verdes Mall, Suite 260
Walnut Creek, CA 94596

1 800 786-9907
1 510 674-0821 FAX
orders@cdrom.com

Many of the programs on this disc are shareware, and require seperate payment to the author for continued use. If you are dissatisfied with the disc for any reason you can return it for a full refund.

Here is a list of some other CD-ROM titles published by Walnut Creek CDROM:

CICA Microsoft Windows CD-ROM - Shareware collection from Ind Univ	$25
Simtel20 MSDOS CD-ROM - shareware/PD swr collection	$25
GIFs Galore - Thousands of GIF images	$25
Hobbes OS/2 CD-ROM - shareware & PD swr collection for OS/2	$25
Garbo MSDOS/MAC CD-ROM - shareware & PD for DOS and Mac	$25
Sprite CDROM - Sprite Research Operating System	$25
Nova CDROM - NeXT Workstation software	$40
Source Code CD-ROM - Usenet source archives on CD-ROM	$40
X11R5 and GNU CD-ROM - X11R5 Window System Source	$40
C User's Group Library CDROM - C source code	$50
Libris Britannia - British shareware	$69

For a more detailed list, you can ftp the latest catalog from cdrom.com:/pub/catalog, or send email to info@cdrom.com.

I'm in d.s. here (that's dire straights :-) and need help finding a
2400 baud DPSK modem that will work with my PK-232.

I purchased the AEA board but they can't seem to find one that doesn't
flake out when it gets warmed up. To my amazement, their "solution" is
for me to send it back for a refund. They absolutely refuse to give me
any support. I guess if you are talking about any technology that's
more than 15 minutes old, AEA isn't interested in supporting you.
CAVEAT EMPTOR!

Anyway, I need this modem to participate in the local TCP/IP network;
there's only one 1200 baud port and I don't have a reliable path to it.

So, what other units are available? I know of only one so far, the
MFJ, which is designed as an internal unit for their tnc. Will that
work with the PK-232, either internally or in an outboard box?

My PK-232 has the TAPR modem disconnect and DCD mods installed.

Does PacComm make one? Anyone know how to contact them? I could not
find any ads in either QST or 73 Magazine...

Replies direct to p00123@psilink are preferred, but posting to this
newsgroup is also ok.

Thanks in advance for the help! 73, Seth

Help!
I have an older Heath HD-4040 TNC with the TAPR TNC-2 upgrade in it, and I
can't seem to get it out of KISS mode. I had to hardwire the baud rate,
(4800), but I can't see how this will make a difference.

I have tried using the WG7J NOS to pop it out, and also physically sent the
three bytes to it ($C0 $FF $C0), to no avail. It seems the only way to get it
out, is to disconnect the battery, but this is a pain. I get the message
Return: 0 with NOS, but I turn the TNC off, and it is back to KISS mode.

BTW--the firmware is version 1.1.7, from TAPR

Any help would be greatly appreciated.

I have heard of TNC's that don't want to stay in KISS mode, but never one that
is permanent. :-)

Any decent terminal software for the Amiga for packet radio?
A friend of mine said that he got some software a few years(!) back with
loads of features packed in, especially for the Amiga...

There must be SOME dedicated packet radio software for the Amiga but where?

Any help appreciated...

Tony.

Keywords: MUD ham packet
Summary: Legal?
Lines: 17

I have been a ham for about a year now, and my interest has slowed. People who
I have introduced packet to are nonplussed. Whatever I show them ,they can do
on the Internet or at their local telephone BBS.

But recently, I have found something that might appeal. The idea of a MUD
(multi-user dungeon) on packet radio. The game is a multiplayer role-playing
adventure, and is only a real phenomenon in the Internet because of the
near-unlimited number of connections that can be made to the MUD host. However,
packet radio has exactly the same connectability as far as I can tell, with
only one transceiver (whereas a phone board requires a modem per connection).

What I want to know is, is this idea old hat? Has anyone done this before?
Secondly, are such activities legal? If they are, are they sanctioned at all?

SUbject says it all....I've just got a Sharp PC 3000, I'd like
to run one of the "TNC"-less software packet programs on it,
either Poor Man's Packet or the ever-popular Baycom. PMP is
probably the best choice since it uses the parallel port; Baycom
apparently needs a really standard serial port and I doubt there's
an INS8250 in this small package. Can anyone provide real
information on the combination of Baycom and PC 3000 ?

Just after I released this list, I received a note that the new Novice and Technician Hypercard Test Stacks by Diana-KC1SP have been out at an ftp'able site. The below information should be used to replace the original text sent out earlier this week.

======== cut here ============
Ham Test Stacks
 HyperCard stacks containing the entire question pool for each license class. Can be used for preparation or generating actual tests.
 The current releases are: Novice v4.1(new questions eff. 7/1/93), Technician v4.0(new questions eff. 7/1/93), General v2.4, Advanced v2.4, Extra v2.4
 If you wish to receive these PUBLIC DOMAIN stacks, please send a SASE (self addressed STAMPED envelope - 2 ounces postage = .52) and 800K diskette to the author: Diana L. Syriac, 3 Spruce Street, Hudson, NH 03051. I will no longer send out the stacks unless the envelope has sufficient postage for return mail (in general, that means .52-.98, depending on size of envelope) and for those who send a standard business envelope, I take no responsibility for the condition of the diskette through USnail.
 Available via anonymous FTP from various sites, including uxc.cso.uiuc.edu (/pub/ham-radio). NOTE: The newest releases of Novice and Technician stacks are available at uxc.cso.uiuc.edu (5/6/93) Author is available via Internet: dls@genrad.com

It works, but the sludge-like performance of 1200 baud packet makes
it about as thrilling as watching paint dry. If you use 9600 baud or
higher it becomes usable.

Let's clear up a misconception here: these programs allow you to run
TCP/IP protocols with other machines which are also sending TCP/IP
packets over the air (embedded inside the standard AX.25 packets).
** This does not imply a connection to the internet. **

If the remote machine you are communicating with happens to have a link
with the internet, then you may have access to the internet, but this
is simply a function of the remote host's hookups and not the fact
that you are talking to it via TCP/IP. It is quite possible that you
could connect to the remote host using simple AX.25 (the raw packet protocol
for amateur packet stuff), and then gateway into the internet from that host.
The only software you'd need then would be your favorite telecomm program.
It would be no different than dialing your work machine from your computer
at home.

If you want special TCP/UDP/IP functionality like 'telnet',
or 'ftp', *then* you'll need to use IP software at your end, but otherwise
you may not.

> ... From what I understand,
> I can take a modem and hook it up to the speaker/mic ports on the radio and
> tune to the correct frequencys (a bit over simplified I know)... What I
> would like to do is purchase a fast (14.4 or V.fast) modem this summer and
> use it this next year.

You need a gizmo known as a "TNC" (Terminal Node Controller) which converts
data into packets suitable for transmission. You can buy a TNC for relatively
small $$ nowadays, these usually include an integral modem. However, these
are not normally high speed (more like 1200 baud typically). Higher speeds
requires better radios, TNC's, modems, etc. with appropriately higher
price tags and complexity. Best bet for some of this stuff is to find a
local ham club and attend one of their meetings and ask folks there.

> Then, hopefully when I graduate and get some sort
> of job I could purchase a radio and tap into the net that way. Is this
> basically what is done, or is this way off also?

I would say that this is NOT usually done, although there are individuals
who have set up gateways to the internet. In general though the common
usage is to set up networking with other hams, not to tap into the internet.

Note that most internet traffic is not suitable or even legal for
transmission on the ham bands. Even if you did manage to find a

local link to the internet, your access would probably be very
restricted.

  > What would the range of
  > this rig be on an average day (broadcasting)?

Depends a great deal on conditions: power output, your antenna,
your antenna location, recipient's antenna, geography, and so on.
Maybe only a few miles for a tiny home installation, although
this can be extended by relaying through other sites.

  > What about licensing? The FCC has the non-codeing ticket, is that enough?

A no-code license is sufficient. You'll need to learn the code if you want
to venture into the HF bands ... but you'd be running in the VHF and UHF
bands for the types of activity we're talking about.

Of course, learning the code can provide its own rewards, but that's
another issue altogether :-)

  > I realise that it takes two to tango, so what about the other end?
  > Are there any sites within the range of the eastern nebraska area that
  > I would be able to feed to/from? Are they normally free, or do they
  > charge a monthly fee?

Commercial activities are forbidden on the ham bands. Hence if you did
find another ham station which provided a link, usage would be free
(although donations might be gratefully accepted :-)).

In summary: offhand I'd say that getting a ham license with the goal
of getting an over-the-air link to the internet would not be a real
effective way to accomplish things. However, there are plenty of fun
things you can do on the ham bands, so I certainly don't wish to
discourage you from going for your "ticket". Good luck with it!

I was just wondering if there is anybody out there who has experience writing
Packet Drivers that meet the FTP specification. I am interested in designing
and building my own interface and would appreciate any input that you may
have. My interface must be designed to have at least 1Mbit/s through put
and the media will be air (wireless transmission). I will (hopefully) have
a customized Spread Spectrum Modem that will be able to take any data that it
receives and transmit/receive it.

I am also interested in the feasibility of incorportating some form of realtime
compression in the data packets. Does any one know if this is feasible?

Thanks

Sean

Hi,

I am a student at uc berkeley working with the solar car team. I am
attempting to build a telemtry system to transmit data from our solar car to
a chase vehicle.

I am attempting to use packet radio for the communication. Right now, I
are attempting to build a controller circuit to interface with the tnc in
the car through an RS-232 port. I need some help in choosing and getting
tnc's and radios for the communication.

I believe that it is possible to interface with a tnc without a computer terminal but all of the literature on the subject assumes the use of a terminal.

We have analog signals which we want to access and transmit in discrete packets over the radio. The signals will be approximately 21 bits in length, and we have about 60 different signals to send.

My plan is to use a selector to choose one analog signal at a time. This signal will then be sent through an a/d converter which outputs a 15 bit parallel signal. This will be combined with 6 bits of state information to identify which signal (of the 60) it is and then sent to a parallel to serial converter. It is the output of the parallel to serial converter that I need to send to the tnc.

I need to synchronize the parallel to serial output with the tnc and also generate the control signals to send over the RS-232 port to initialize the tnc. I need help in determining the exactly which control signals are important (i.e. cts, rts, dcd, dtr...). I also need to know what the appropriate voltage levels for these signals are.

For example, I believe that the data pin should be kept high until the data is sent and then a low signal signifies the beginning of the data. Unfortunately, I don't know what the correct voltages are for high and low for any of the pins. Some literature refers to standard TTL interface and then also talks about +5 volts as high and -12 volts as low.

Any help anyone could give would be greatly appreciated.
Thank you very much.

with Kantronics Data engine and DE9600/DE19K2 modem. Got
2 sets of radios/modems to transmit, but don't see a connect
on either one. Screwed around with R18, but that didn't seem to
make too much difference. Anybody out in NetLand got this combo
working, pls email to address below.
TIA

Packet -> Internet:
Send as private mail (not a bulletin) to the packet address:
     gate@wb7tpy.az.usa.na

The first line of the text must contain a full domained internet
addresss, preceeded by the word "Internet:" Be carefull that any
software you use doesn't add extra headers. I don't know how to
get around the increasing number of forwarders who add their bbs
into your message, preceeding your text. The "Internet: ..." line

must be the first line when it arrives at wb7tpy.

Have fun!

Organization: Pacific ESI, Sydney, AUSTRALIA
Lines: 32

Someone asked about a problem with FBB and the BPQ switch reassigning
port numbers, and Roy stepped in with a little plug :-) Anyway, I
sent the question to my FBB BBS Sysop, and here is the reply. Note that
since the original message has now expired (and I forgot to keep a copy
of it) I have no idea who was asking it :-(

Hi Dave. It is in the INITTNCx.SYS files. For G8BPQ you have to tell it how
many streams there are per virtual port. If you have say 4 ports defined in
the PORT.SYS (FBB) file for 2m and 2 ports defined for 70cm, then the first
INITTNC1.SYS file must contain the definition "N1" meaning that the streams
start at 1 and are numbered 1, 2, 3, 4. In INITTNC2.SYS, the "N" parameter
must be one greater than the number of streams on the first one, so you
specify "N5" (to get ports 5 and 6 on the 2nd TNC). If you had a third port
then the INITTNC3.SYS would contain "N7" etc... This is all for G8BPQ's
benefit otherwise it mixes up ports on the virtual TNCs. Hope that is
coherent :-) Cheers.
...Steve

Hope that helps; after upgrading to FBB from RLI I am really impressed
with it! Oh, no offence to W0RLI, since we upgraded in turn to his
system from MBL and various others...

Data point: most of VK seems to be running FBB; AA4RE seems to be
unknown here.

I am looking for information about how to use a Tandy 100 or
102 old fashioned laptop to set up a portable packet
system, as cheaply as possible.
Any info appreciated, post or email to above header address.
thanks, Mike

For those who are interested, the FCC does indeed care about cable
leakage, particularly into the aviation nav band, or leakage that
is "causing interference to other services".

Part 76.611 details specific limits to acceptable leakage, and
measurement technique. If you will clearly document your problem,
and measurement technique (a signal level meter with dipole is the
normal approach, remember to correct between measurement data and
microvolts per meter) and fax or mail the details to Mr. John Wong
Cable Branch, FCC 1919 M st. NW Wash DC, and a copy of your letter
to the local cable company, you will get results. In fact the cable
company will probably start treating you much better when they realize
you have figured out how to get the FCCs attention.

What is important is to document your case as it relates to the
applicable rules. However the cable company *is required* to
at least check out every complaint of leakage. They must file
with the commission and maintain on premises a yearly measurement
report that details the results of leakage testing.

But remember, call the cable company first, and give them a
chance to work to correct the problem before contacting
the commission.

I am in the business of measuring cable system leakage via
the airborne method.

SB SYSOP @ ALLUS < NO8M $28313_NO8M
HF Autoforwarding ARRL Petition
R:930426/0422z 28313@NO8M.#NEOH.OH.USA.NA

There are two active processes that affect packet radio under consideration by the FCC. The first deals with the responsibility of the originator and first forwarder as to message content. The second deals with the formation of HF forwarding subbands for automatic operation.

The first appears to be of little concern. We hold all messages that come into our PBBS. (Yes, even those that will not be forwarded. We will be responsible for the automated retransmission. We must therefore hold any message originated on our system.)

The second may or may not be of concern. During the FCC and ARRL forums at the Dayton Hamvention, it was stated that a petition was filed by the ARRL on April 16 requesting a NPRM for HF autoforwarding subbands. I have asked my Section Manager for a copy of this petition.

When someone files a petition with the FCC, there is a 30 day period in which comments can be made. The FCC may then issue a NPRM which begins a second comment period. It is during the second comment period when we normally get involved. However, this FIRST 30 day period is also open for comments as to if the FCC should even open a NPRM.

This will effect HF packet, Pactor, Clover, RTTY MSOs, and DX Packet Cluster links and all forms of communications where a control operator is not present at BOTH sides of the link.

I was chagrined to find the normal rabid anti-HF operation from the DXers. Severely limited subbands will be as terminal to their HF Cluster links as it will to Clover. As is normal, the manufacturers were unconcerned.

This information is presented for your consideration.

73,
Steve

It must be noted that at Dayton there was virtually no discussion about HF packet. Others buzzed with excitement over Clover, the announcement of the new Pactor II, DSP units, etc. etc. It certainly looked like HF packet is stagnant, old, RTTY-like mode that was unworthy of comment or concern.

I would like to be able to set my system's clock accurately. Is there a UTC
time signal available via packet so that I could have my system automatically
set its own clock? (Perhaps via an OSCAR?) Is there an alternative so that
I could set my system's clock accurately?

NOTE: This is just something that I would like to do if it is available.
I'm interested in a zero (or near zero) cost solutions (assuming that I
already have amateur radio and packet equipment). However, I would be
interested (for academic reasons) in hearing about other solutions.

               Thanks in advance,

Message-ID: <735680955snz@tedb.demon.co.uk>

Good morning. It's Sunday the 25th of April and here is the GB2RS news
broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- BT supports amateur radio; a radio amateur is
prosecuted; and a there's a possible licensing hitch for married amateurs.

British Telecom has indicated its support for the RSGB's Project YEAR by
donating videos and booklets to help with Novice training. Project YEAR -
Youth into Electronics via Amateur Radio - is an ongoing initiative by the
Society aimed at encouraging young people into the hobby. It involves several
books, the Novice Licence, a video - Amateur Radio for Beginners - which is
available to clubs from the RSGB Audio Visual Library, and a magazine D-i-Y
Radio.

If your club is holding an event which is particularly suited to the beginner or Novice licensee, the RSGB can provide publicity for the event in D-i-Y Radio. Details of relevant meetings, rallies or open days should be sent to Marcia Brimson at RSGB HQ, marked D-i-Y Radio. And don't forget to tell us about any committee members with special responsibility for newcomers and Novices.

The Radiocommunications Agency of the DTI has announced a successful prosecution under the Wireless Telegraphy Act 1949. On the 25th of March, at Lisburn Magistrates Court in Northern Ireland, a radio amateur was fined a hundred pounds with ten pounds costs and had to forfeit his transceiver said to be worth five hundred pounds. The prosecution, which was for using frequencies not covered by the defendant's licence, came about following television interference complaints and followed several warnings. Next Thursday, at Dudley Magistrates Court, the RA will be prosecuting another radio amateur in a case which involves abuse of the amateur repeater network in the Midlands. The RA says that information supplied by the RSGB's Amateur Radio Observation Service was particularly helpful in preparing the case.

The RSGB '93 Show takes place on Sunday the 16th of May at the National Exhibition Centre, near Birmingham. There will be the usual trade stands in a single huge hall, plus a large display of the work of RSGB Headquarters and of the Society's committees. The National Vintage Communications Fair is also being held that day in the NEC complex. Many visitors will wish to visit both shows and reduced rates are available for this.

The May edition of Radio Communication will be posted to all RSGB members in the next few days. It contains the latest on RAEN Ltd, repeater licensing and VHF awards. The full text is given of the amendment to the Amateur Radio Licence, concerning the 430MHz band, which we announced recently on GB2RS.

The organisation which processes amateur radio licences, Subscription Services Ltd, has said that it regrets that, at present, it can collect only one Direct Debit from a bank account for licence renewal fees. This has caused difficulty where two licensees sharing a joint bank account have different renewal dates. The situation is likely to be resolved shortly but in the meantime anyone who is in this position is advised to make alternative payment arrangements.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Bahrain, DL1WH will sign A92WH from now until the end of June 1993. He may also use the club callsign A92C. From Crete, a group of Greek amateurs will use the callsign J49GI from Gavdos Island, starting on Sunday the 2nd to Friday the 7th of May. Check these frequencies: On CW 1835, 3525, 7025, 14025, 21025 and 28025kHz and for SSB 1845, 3795, 7045, 14195, 21295 and 28495kHz. They also hope to be on the WARC bands. From Sierra Leone, K5LBU is now active as 9L1CB. His tour with of 2 years with the Baptist Mission ends in early 1995. From Kampuchea, HA7VK is now active as XU7VK from now until the end of June. From Tromelin Island, FR5ZQ/T is said to be active around 14.120MHz after 1700GMT. From Guadeloupe Island, the XF1G team now expect to be active from now until Thursday the 29th of April.

We know of three rallies scheduled for today, Sunday the 25th of April:

The Bridlington and District Amateur Radio Society's East Yorkshire Rally is being held at The Spa, Bridlington. Doors open at 11.00am, or 10.30am for disabled visitors. There are many traders, club stands and a bring & buy stall. Refreshments are available.

The Bury Radio Society Hamfeast is being held at the Bury Leisure Centre, Bolton Street, Bury, Lancs.

The Dacorum Amateur Radio and Transmitting Society Car Boot Sale is being held at the Heath Park Hotel, Hemel Hempstead, Hertfordshire.

Rallies for Sunday the 2nd of May:

The Anglo-Scottish Rally is to be held at Tait Hall, Kelso. Further details can be obtained from Bruce, GM4UIB, by telephoning 0573 224654 (evenings only).

The British Amateur Television Club Rally is to be held at Harlaxton Manor, Near Grantham, Lincolnshire. It is just one mile off the A1 (signposted). Doors open at 10.00am. There will be the usual traders inside and an outside flea market. The event features a lecture programme and demonstrations, and refreshments will be available. Talk-in will be on Channels S22, SU22 and via GB3GR on RB11. The entrance fee covers access to the new Harlaxton Gardens which is an ideal family venue. A substantial reduction in entrance fee is available on production of a copy of Radio Communication or CQ-TV magazines. Further details are available from Paul, G8MJW on 0522 703348.

Rally for Monday the 3rd:

The Mid Cheshire Amateur Radio Society Rally is to be held at the Civic Hall, Winsford, Cheshire. Doors open at 11.00am, or 10.30 for disabled visitors. Full catering and ample car parking. Further details can be obtained from David, G4XUV on 0606 77787.

News now of a cancelled Rally:

The Scarborough Amateur Radio Electronics and Computer Rally scheduled for Sunday the 25th of July has had to be cancelled by the organisers. They will now concentrate on finding a suitable new venue for July 1994. Further details from Ross, G4ZNZ on 0723 514767.

HF contest news next:

The RSGB's 1993 National Field Day, the Golden Jubilee event, takes place in June. All Groups intending to participate are reminded that they need to send details of their site to Chris, G3SJJ, QTHR, to arrive no later than the 1st of May 1993. See February RadCom page 66 for further details. The next RSGB Slow CW Cumulative Contest takes place on Thursday the 29th, from 1830 to 2000GMT, using 3.530 to 3.580MHz only. See March RadCom, page 81 for the rules. The AG CW DL QRP/QRP Party is scheduled to run from 1300 to 1900 on Saturday the 1st of May using 3.510 to 3.560MHz and 7.010 to 7.040MHz CW only. See April Radcom page 13 for band and class details.

Now some UHF contest news:

The RSGB 432MHz to 24GHz Contest starts next Saturday the 1st at 1400GMT and finishes at 1400GMT on Sunday the 2nd of May. Also during Saturday the 70cm Trophy Contest will take place from 1400 to 2200GMT. See February RadCom page 66 for details, but note that the date for the 70cm Trophy is printed incorrectly; it should read the 1st of May.

Special event stations this week include:

GB2AMN which will be aired by RAF Finningly Amateur Radio Society during today Sunday the 25th to celebrate the opening of Newark Air Museum 20 years ago. The station is operating from two aircraft in the static display at the Museum; the HF station from a Varsity and the VHF SSB station from a Shackleton. All contacts plus SWL reports will receive a QSL card.

And now the solar factual data

There is an extended period this week - the 9th to the 18th of April - due to catching up with the missing holiday data. Solar activity collapsed on the 13th when the sun spot count dropped to only 15, and further declined to only 12 by the 14th; this is the lowest level since February 12th 1988. Levels improved slowly and the count reached 67 by the 18th. The period meaned about 68. There has only been 1 flare of any note during the period, an M8.7/1B on the 18th, which was accompanied by types 2 and 4 radio wave sweeps. These are mainly in the HF region down to about 5MHz. Solar flux levels were up to 136 units on the 12th, but declined to only 88 units by the 15th. However levels were recovering by the 18th when they reached 106, the period averaged 105 units. The geomagnetic Ap index has been mainly unsettled throughout the period, but the 9th was up to a sub storm level of 32 units, and the period 13th to 15th was up to sub storm levels of 28 units. The period averaged 19.8 units. The state has been nil, nothing to report, all the period. The radio quality indices have declined almost every day from just normal down to very poor by the 18th; all circuits have at various times been down to very poor. This week we have not yet received the aa indices. The X-ray flux declined to the lowest levels so far since this data has been broadcast. On the 15th and 16th levels declined to only A7.8 but recovered to B2.0 by the 17th; the period averaged about B2.9.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers, as reported by Meudon, declined and levels averaged 7.4MHz, though some days were down to 6.8MHz. The darkness hour lows averaged 3.0MHz and have not varied much day to day. The lows are now about 0400 hours but the highs are anything between 1200 hours up to 1900 hours varying considerably day to day.

Now the ionospheric data for the north:

Since the 10th April we are now getting the F2 daytime critical frequencies

from Ekaterinberg again - it is not known why they stopped - so for the daily highs levels averaged 7.8MHz. The darkness hour lows averaged 3.1MHz.

And lastly the solar forecast:

This week it seems that a major restructuring is taking place on the sun and until this is established it is very difficult to say what is likely to happen. It looks likely that a more active part of the sun will be looking our way. Solar flux levels are likely to be about the 120s. Geomagnetic levels are expected to be just unsettled. Past history of the radio quality indices suggests that ionospheric conditions should be up to normal.

And that is the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 T O and G7 O V series, and Novice calls in the 2 0 A F and 2 1 B Q series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Here is the instruction sheet for my gateway. Only hams on internet can traverse the gateway into packet. If you have questions feel free to send me a note.

The sections you will be most intrested in are REGISTRATION and SENDING MAIL
TO PACKET USERS.

Bob Arasmith
   bob@hal.com (work)
   bob@arasmith.com (home)
   n0ary@n0ary.#nocal.ca.usa.na (packet)

N0ARY/BBS Internet Gateway Operating Instructions
April 1993

LOCAL USERS:

Local users are those that log into the bbs via the bbs's telephone modem port (408-749-1950) or via one of the 3 tnc ports (144.93, 223.62, 433.37). Each local user has a bbs account that is used to customize how the bbs interacts with the user.

Local users can set their account up so that all incoming mail addressed to their call will be forwarded via a gateway to internet and on to other networks (mcimail, compuserve, etc). All the user needs to do is enter his email address and turn the feature on.

```
EMAIL bob@hal.com
EMAIL ON
```

When the EMAIL feature is turned on the packet message will be deleted at the time of forwarding through the gateway. So care should be taken that the paths are correct prior to turning the feature on, for instance enable it, send a test message, and disable it. After a successful transfer re-enable the feature. To disable the auto forwarding feature simply type:

```
EMAIL OFF
```

Messages can be sent by packet users to the internet users via the gateway. This applies to users at N0ARY as well as users at other bbs's. Begin by sending a message to IPGATE@N0ARY with the first line of the message being the letters "To:" followed by the internet address of the recipient.

```
N6ZFJ de N0ARY >
  sp ipgate@n0ary
Enter your subject:
  Meeting?
Enter your message body:
  To: bob@hal.com
  Are you planning to attend the club meeting on Thursday? Give me
  a call. 73, Connie
  ^Z
```

NOTE: That the recipient cannot respond to the message unless they
are a ham and registered with the gateway. He/she becomes registered by
sending a message from his internet host to gateway-request@arasmith.com.

REMOTE USERS:

Remote users are those that do not log into N0ARY directly but merely
appear from the packet world to use it as home. If a packet user checks
the "White Pages" for a remote user the entry comes back as @N0ARY.
The packet user then address his message to YOURCALL@N0ARY and the
bbs will do the translation and forwarding to internet.

It is not necessary for a person to know your actual internet address
nor use the SP IPGATE method described above. From the packet network
it appears that you are just another user at N0ARY.

WHITE PAGES:

The "White Pages" is a distributed database of all the bbs users. Most
bbs users in the US are represented in the database as well as many from
other countries. An entry consists of; call, home bbs, first name,
zip, city and state. When a user wishes to send another packet user
a message he/she consults the white pages (WP) for the home bbs.

REGISTERING:

Before a user, both local and remote, can send a message from internet
into the bbs system he/she must register with the gateway. This is done
by sending a message from the host that he/she intends to use to
gateway-request@arasmith.com with the following information:

  CALL:
  FIRST NAME:
  CITY & ST:
  ZIP:

When a request is received the "From" field is copied directly into
a file with the requesters call. Whenever the gateway receives a message
bound for packet it scans this file comparing on the "From" field. When a
match is found the gateway uses the associated call from then on. If
there is no match the mailer bounces the message with a one-liner
indicating the the user must register.

If you currently use another bbs as home this needs to be stated
in the request. Otherwise you will be assigned N0ARY as your home.
If you choose not to use N0ARY as your home you must make sure
people know to send your message to YOURCALL@N0ARY to pass through
the gate. Your WP entry will be wrong.

EXECUTING BBS COMMANDS REMOTELY:

Many of the commands available to local users is also available to remote users by sending a message to the bbs. Here is a subset of the commands currently available.

LIST	listing messages
LOOKUP	look up calls in the on-line callbook
WHO call	dump a users account information
READ	read messages and files
USERS n	display the last n users to connect to the bbs
INFO	display manual pages of various topics
CD	change directories in the file system
LS/DIR	display the contents of a directory
WP call	look a user up in the "White Pages"
HELP	get help on how to use a command

Not all commands available to local users can be accessed via the gate. All interactive commands are disabled as well as commands that modify the users account.

The command parser for the bbs is very powerful and the user can form very complex requests. For instance the following command is valid on the bbs:

```
LIST LAST 20 BULLETINS FROM N0ARY
LIST ALL BULLETINS ABOUT KENWOOD
```

The ABOUT keyword is used to search the subjects of messages for a given pattern, in this case KENWOOD. It can appear anywhere in the subject line.

This is an example of how complex all the commands can become. They can also be abbreviated down to the level understood my most other bbs programs. Any of the following will give the same results.

```
L< N6ZFJ
LIST FROM N6ZFJ
LIS < N6ZFJ
L FR N6ZFJ
```

In most cases a minimum number of unique characters is needed to distinguish a command.

You can get a list of commands and a translation chart from W0RLI to N0ARY by typing the following commands.

```
INFO COMMANDS
INFO W0RLI
```

Other commands that you may wish to execute are:

```
  INFO MANUAL
  HELP HELP
  HELP LIST
```

Now that you know what some of the commands are this is how you go about executing them. You send a message to cmd@bbs.arasmith.com with your commands entered one per line or separated by semicolons. For example if you want to know if three of your buddies are in the white pages and if the bbs has any messages about the ICOM W2A.

```
  % mail cmd@bbs.arasmith.com
  Subject: you can put anything here
  wp n0ary n6zfj n6une
  list all about w2a
  .
```

The bbs will execute the commands and respond to you via return mail.

SENDING MAIL TO PACKET:

Once registered the user is free to begin using the gateway to send messages from his host through the gateway into the packet world. How much you have to specify of a users address depends on how much the bbs already knows about the user.

If the bbs knows the home bbs of the user and his home bbs is know to the the N0ARY bbs, which most of them are, you simply need to supply the call.

```
  n6zjf@bbs.arasmith.com
```

If the N0ARY bbs doesn't know of the user but does know where his home bbs is then you need to supply just the home bbs call in addition to the users.

```
  n6zjf%n6qmy@bbs.arasmith.com
```

Notice that the call and home bbs are separated by a percent sign '%' rather then the '@' which is used in the packet domain. This is because the '@' has a meaning in the internet address.

If the bbs has no knowledge of either the user or his home bbs then you probably have the wrong home bbs or it is a new bbs. In which case you will have to supply the full address so the bbs will know how to route the message.

```
  n6zfj%n6qmy.#nocal.ca.usa.na@bbs.arasmith.com
```

This level of addressing is hardly ever needed and normally means that the home bbs is in error.

Bulletins can be sent in a similar fashion. The address is made up

of a keyword, which can be any six character word and a distribution. Distributions are local to an area. For instance SBAY is valid in northern CA, it probably has no meaning at all in Topeka, KS.

Valid distributions are:

ALLUS	please avoid this one
ALLUSW	all western US
ALLCA	all California, any 2 letter state should work

So if you trying to find a cw filter for a Kenwood TS440.

```
want%allca@bbs.arasmith.com
Subject: Kenwood TS440, CW filter
If you have one of these you are willing to part with please
give me a call or leave message, thanks.
73, N6ZFJ@N0ARY.#NOCAL.CA.USA.NA
.
```

Be descriptive, brief, and always include your full return address in the message. Also please try to limit your distributions to small regions. Using the ALLUS distribution really slows down the flow of messages.

INFO ON THE N0ARY BBS:

The bbs came into being in July of 1990 and as of April of 1993 had over 1000 users, 800 registered as home. The bbs has 3 rf ports, 2 phone ports, the internet port, and a voice synthesizer port. The latter allows users to check for messages via DTMF from their handhelds.

The bbs itself runs on a Sun workstation under Unix. The code was written by Bob Arasmith to focus on the user. Great care was taken to make the bbs very forgiving to the novice user but very flexible and powerful for the old-timer. The bbs can be configured to interact with each user differently. Some examples are:

* List messages in either descending or ascending order.

* Specify a list of keywords that the user wishes not to see displayed when a list is performed, similar to a kill file.

* .signature and .vacation files.

* Specify how many lines the users terminal is capable of displaying before scrolling, the bbs will feed info this many lines and pause allowing the user to catch up and continue or abort the operation. Similar to more.

* Users can put commonly executed commands in keystroke macros that are accessible via a single keystroke.

A manual is currently available describing the commands and their

permutations. This manual will be available in mid 1993 as a
postscript file. Run the command INFO MANUAL to learn how to get
one via the post office. It is not available in an ascii format.

If you have any questions about the internet gateway or the bbs
in general please drop me a message.

A friend of mine is looking for PE1CHL TCP/IP software for his Atari ST...
we found an old version on ucsd.edu for the PC but I can't find the latest
version I've been hearing about, dated 930411. I'm also looking for the same
software but for Linux -- can anyone help?

Thanks,
       Ian.

If I remember rightly, there is a pulsating set of tones piped thru the CATV
systems (somewheres near the FM broadcast band). And that the cable company
trucks listen for this as they roam around town. If you can hear it over
the air and not cable....

Hi.
A friend picked up a copy of SofTNC for me at Dayton, and I thought
that I would pass along the mailing address information for
j*Com for other PMP fans who are interested:

The product is called "SofTNC" for PC's, and it works with
Baycom serial port style modems (as well as PMP style modems, I think).
It is basically PMP with the keyboard handling routines rewritten
to use interrupts so that you can actually continue *typing* when
the computer is busy with traffic on the channel.

  j*Com (WJ6COM)
  Box 194
  Ben Lomond, CA 95005
  408-335-9120

  408-335-9121 fax

It cost $20 at Dayton.

I can't give a review of it, because my radio is in the shop, but I have
lots of confidence in N8KEI based on his track record with PMP.

Subject: rec.radio.amateur reorg - final proposal after 30-day discussion
Message-ID: <bbVY03MJd0P.00@amdahl.uts.amdahl.com>
Date: 27 Apr 93 07:10:51 GMT
Followup-To: rec.radio.amateur.misc
Organization: Amdahl Corporation, Open Systems Development, Santa Clara CA
Lines: 70

Results of the discussion on the rec.radio.amateur reorganization
----
30-day discussion period ended: April 26, 1993

Based on a Request for Discussion (RFD), a discussion of a possible reorgani-
zation of rec.radio.amateur was held for 30 days on the news.groups newsgroup.
The location of the discussion was required by the "Guidelines for UseNet
Newsgroup Creation" and was announced many times in the rec.radio.amateur.*
newsgroups.

The result of the 30-day discussion appears favorable so we will proceed with

the next step in the guidelines. A Call for Votes (CFV) will be issued as soon as arrangements for voting can be made. (See "Notes on how to proceed with the CFV" below.)

Unchanged Newsgroups

It was agreed that these newsgroups will not change. They will not be on the CFV.

```
rec.radio.amateur.misc                  all Ham radio topics not covered below
rec.radio.amateur.policy                regulations & policy issues
```

Newsgroups That Will Be on the CFV

All of these groups are UNMODERATED.

```
rec.radio.amateur.digital.misc          packet radio & other digital modes
                                        [includes old rec.radio.amateur.packet]
rec.radio.amateur.digital.tcp-ip        TCP/IP via packet radio
rec.radio.amateur.dx                    DX (long distance) communications
rec.radio.amateur.antenna       discussion of amateur radio antennas
rec.radio.amateur.equipment             amateur radio equipment: manufactured
                        products, modifications
rec.radio.amateur.instruction           Ham radio instruction & examination
rec.radio.amateur.operating             discussion of operating procedures
rec.radio.amateur.homebrew              radio construction & experimentation
rec.radio.amateur.space                 amateur radio in space: satellites,
                                        earth-moon-earth (EME), shuttle, MIR
rec.radio.amateur.emerg-services        emergency services: RACES, ARES, NTS
rec.radio.amateur.rdf                   radio direction finding: recreational
                        hunts and searches for interference
```

Notes on how to proceed with the CFV

The guidelines say that there should be minimal delay between the close of the discussion period and the posting of a CFV. In order to comply with that, we'll take this back to the rra-reorg mail list. If you would like to join the discussion to help review the final wording of the CFV, send mail to

```
     Internet mail: rra-reorg-request@amdahl.com
     UUCP mail:     amdahl!rra-reorg-request
```

and you will be added to the list.

All decisions made in the discussion period will be held UNMODIFIABLE in the writing of the CFV. The scope of the discussion will encompass wording of a proper CFV based on this discussion and arrangements for a vote-collecting site. This may include filling out the wording of the newsgroup charters but not changing their intent.

Note: the 4/24 "evolving proposal" said that we might use MIT's offer to host newsgroup votes. As it turns out, that may not be possible because the student/employee who handles that is in the crunch period prior to graduation.

The members of the rra-reorg mail list will need to determine an acceptable
site for the voting.

I have downloaded all files you need from KO-23 (Kitsat) including Linux.
Waiting for Rob's upload of Sparc version.

I will upload the package to hamradio/packet/tcpip/incoming: where I think
it's the place should be.

Join us in KO-23!

Because the previous FAQ seems to have been received corrupted by a number of
sites, I am reposting it ahead of schedule. It will next appear on 22 May 93.

Frequently Asked Questions for Amateur Packet Radio

Version 1.13 - Last modified 2/21/93

This document is for unlimited distribution.

Please send corrections and additions to:
   packet-faq@wattres.sj.ca.us
Which will expand to a list of people who are familiar with most packet
issues. I hope. ;-)

The Packet Radio FAQ's will be posted on a monthly basis to
rec.radio.amateur.packet. The current version of this document is
available via anonymous FTP at ftp.cs.buffalo.edu.

Many FAQ's, including this one, are available on the archive site
rtfm.mit.edu in the directory pub/usenet/news.answers. The name under
which a FAQ is archived appears in the Archive-Name: line at the top

of the article. This FAQ is archived as radio/packet-faq.

There is also a mail server on rtfm.mit.edu, which can be addressed as mail-server@rtfm.mit.edu. For details on how to operate this server, send a message to that address with the word "help" in the BODY of the message.

1 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small bursts, or packets.

1.2 What is amateur radio?

Amateur Radio (sometimes called Ham Radio) is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions posting in rec.radio.amateur.misc. A copy of that FAQ is also available from ftp.cs.buffalo.edu.

1.3 What can I do on packet radio?

Keyboard-to-Keyboard contacts:

Like other digital communications modes, packet radio can be used to talk to other amateurs. For those who cannot use HF frequencies, two amateurs can talk to each other from long distances using the packet radio network.

Packet BBS operations:

Many cities have one or more packet Bulletin Board System (BBS) available on the local packet network. Amateurs can check into the BBSes and read messages from other packet users on almost any topic. BBSes are networked together over the packet network to allow messages to reach a broader audience than just your local BBS users. Private messages may also be sent to other packet operators, either locally or who use other BBSes. BBSes have the latest ARRL, AMSAT, and propagation bulletins. Many BBSes have a file section containing various text files full of information on amateur radio in general.

DX Packet Cluster:

A recent development is use of packet radio for DX spotting. HF operators connect to the local DX Packet Cluster for the latest reports on DX. Often a user will 'spot' some hot DX and distribute the DX report real time.

File Transfer:

With special software, amateurs can pass any binary files to other amateurs. Currently, this is done with TCP/IP communications, YAPP, and other specialized protocols.

Satellite Communications:

Many of the amateur radio satellites contain microcomputer systems that can provide special information to amateurs. Some satellites contain CCD cameras on board and you can download images of the earth and the stars. Others provide store and forward packet mailboxes to allow rapid message transfers over long distances. Some satellites use AX.25, some use special packet protocols developed for satellite communications. A few transmit AX.25 packets over FM transmitters, but most use SSB transmissions.

1.4 Why packet over other digital modes?

Packet has three great advantages over other digital modes: transparency, error correction, and automatic control.

The operation of a packet station is transparent to the end user; connect to the other station, type in your message, and it is sent automatically. The Terminal Node Controller (TNC) automatically divides the message into packets, keys the transmitter and sends the packets. While receiving packets, the TNC automatically decodes, checks for errors, and displays the received messages. In addition, any packet TNC can be used as a packet relay station, sometimes called a digipeater. This allows for greater range by stringing several packet stations together.

Packet radio provides error free communications because of built in error detection schemes. If a packet is received, it is checked for errors and will be displayed only if it is correct.

With VHF/UHF packet, many countries allow packet operators to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBSes (sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to use the same frequency channel simultaneously.

1.5 What elements make up a packet station?

TNC (Terminal Node Controller): A TNC contains a modem, a CPU, and the associated circuitry required to convert between RS-232 and the packet radio protocol in use. It assembles a packet from some of the data on the serial line, computing an error check (CRC) for the packet, modulates it into audio frequencies, and puts out appropriate signals to transmit that packet over the connected radio. It also reverses the process, translating the audio that the connected radio receives into a byte stream on the RS-232 port.

Most TNC's currently use 1200 BPS (bits per second) for local VHF and UHF packet, and 300 BPS for longer distance, lower bandwidth HF

communication. Higher speeds are available for use in the VHF, UHF, and especially microwave region, but they often require unusual hardware and drivers.

Computer or Terminal: This is the user interface. A computer running a terminal emulator program, a packet-specific program, or just a dumb terminal can be used. For computers, almost any phone modem communications program can be adapted for packet use, but there are also customized packet radio programs available.

A radio: For 1200 BPS UHF/VHF packet, commonly available narrow band FM voice radios are used. For HF packet, 300 BPS data is used over single side band modulation. For high speed packet (anything greater than 1200 BPS), special radios or modified FM radios must be used.

1.6 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSMA (Carrier Sense Multiple Access). If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the TNC keys up the radio, and sends its packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet.

In actuality, a more complex scheme is used to determine when the TNC transmits. See the "AX.25 Protocol Specification" for more information.

1.7 What is AX.25?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified to suit amateur radio's needs. AX.25 includes a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the sender's and recipient's amateur radio callsign, thus providing station identification with every transmission.

1.8 Definitions: Commonly used terms in Amateur Packet Radio

44 net - The class A network designator for TCP/IP amateur packet radio. All numerical TCP/IP addresses are in the format 44.xxx.xxx.xxx.

AFSK - Audio Frequency Shift Keying. A method of representing digital information by using different audio frequencies modulated on a carrier.

AMPR - Amateur Packet Radio.

ampr.org - The high level domain recognized on Internet for amateur packet radio TCP/IP.

AX.25 - Amateur X.25 protocol. The basis of most packet systems. See section 1.7 for more information.

CRC - Cyclic Redundancy Check. The error detection scheme included in each packet. Verify that the packet was received error free.

CSMA - Carrier Sense Multiple Access. A system allowing many stations to use the same radio frequency simultaneously for packet communications.

digi - Short name for a digipeater

digipeater - A packet radio station used for repeating packets. See section 3.3.1 for more information.

FCC - Federal Communications Commission. Regulates and issues licenses for amateur radio in the United States.

FM - Frequency Modulation. The radio modulation scheme used for VHF and UHF packet communications.

FSK - Frequency Shift Keying. A method of representing digital information by shifting the radio carrier frequency different amounts to represent ones and zeros.

HDLC - (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

KA9Q NOS - (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

KA-Node - A simple networking scheme developed by TNC maker Kantronics. See section 3.3.2 for more info.

KISS - Keep It Simple Stupid. A simple interface developed for communications between TNCs and computers. This allows for most of the packet processing to be handled by the computer. Commonly used with packet TCP/IP software.

LAN - Local Area Network. A packet network developed for communications throughout a city or region. Often, the LAN uses separate frequencies from inter-city packet links.

modem - MODulator/DEModulator. Converts the analog signals into a binary data stream (a series of ones and zeros) for the TNC or a micro-computer. First step in decoding packets. It also converts binary data to analog, which is the last step in encoding packets.

NET/ROM - A scheme for packet radio networking. See section 3.3.3 for more information.

NODE - A network node. Often a network node running NET/ROM.

PPP - Point to Point Protocol. PPP is another protocol used for moving IP frames over a serial line. It supports host authentication, and non-transparent serial lines. It also has a standard way of negotiating header (and potentially data) compression over the line. See also SLIP.

protocol - A standard used for intercommunications between different computer systems.

RS-232 (RS-323C) - A (more or less) standard for interconnection of serial peripherals to small computer systems. In packet radio, RS-232 is the most common interface between TNC's and the Computer/Terminal.

SLIP - Serial Line Internet Protocol. A trivial protocol for putting IP frames over a serial line to do (potentially) cheap TCP/IP networking. Approximately the same as KISS, except over wireline networks. See also PPP.

SSB - Single Side Band. The radio modulation scheme used for HF packet and satellite packet communications.

TAPR - Tucson Amateur Packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many others. TAPR continues development of packet radio equipment.

TCP/IP - Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more information.

TNC - Terminal Node Controller. See section 1.5 for more information.

1.9 Do's and Don'ts : Rules and Regulations

NOTE: These regulations apply only to amateurs regulated by the FCC (United States), but often are similar to regulations in other countries.

[Since I have no experience with amateur radio in other countries, I cannot make any comments. Please bring any notable exceptions to my attention. -ed]

Although there are no specific rules that apply to amateur packet radio, the general amateur radio rules force some restrictions on packet usage.

> Can I set up a TNC at home and one at work so I can check my Electronic mail via packet?

This cannot be done without special restrictions. Amateur radio rules prohibit any business. Since you could have mail from your boss (or maybe even someone selling you something over Internet), that would constitute business activity and is specifically prohibited.

Profanity can also be a complication. Since you have no control over the language used in E-mail, proper filtering is required. Since no filter scheme can catch every offense, it is best to say every message must be hand filtered.

> I would like to set up a packet radio gateway between a land line computer network and the packet network. Is this possible?

Yes, and there are several such gateways in use, but they must be managed with caution. Electronic mail may be passed FROM the packet network INTO the land line network without intervention. However, mail passed TO packet radio is considered third party traffic (the sender is not an amateur) and these messages must be hand filtered to ensure that rules of message content are followed.

> It's my license if I use packet radio illegally anyway, so what does anyone else care!?

Packet radio is one of the few NETWORKED systems in amateur radio. Many people have helped develop the network and there are many amateurs who own parts of the packet radio network. Sending packet BBS mail, digipeating, and sharing the channel involves the licenses of MANY people. Because of FCC rules stating that anything to come out of a transmitter (either in automatic mode or via your direct control) is the licensee's responsibility, one illegal message sent over the packet radio network could literally jeopardize the licenses of thousands of other amateurs. When in doubt, it is best to check with other amateurs about sending the message before it is sent.

> I have some ideas on how to use packet radio in a new way, but I don't know if it is legal. Who could tell me if I can do it legally?

The worst thing you can do is talk to the FCC about such an issue. The FCC rules are written to be general enough to encompass but not restrict new radio activities. In the past, any non-thought-out requests sent to the FCC have meant a reduction of privilege for all amateur radio operators.

The best source for legal assistance is your national amateur radio association. In the United States, that is the American Radio Relay League (ARRL). Another good place for such conversations is over Usenet/packet mailing lists, or the amateur radio BBS network.

2 Computing Network Resources for Amateur Packet radio

This section summarizes the resources available on Internet for amateur packet radio operators.

2.1 What Newsgroups/mailing lists are available?

This is a list of all groups that regularly discuss amateur packet radio. For newsgroups, join the group through use of your news reader. For mailing lists, add a '-request' to the end of the list name to request subscriptions. For listserv groups, send mail to 'listserv' at the node which contains the list. The first line of the mail should be 'SUBSCRIBE groupname yourname'. Send the command 'help' for more information.

rec.radio.amateur.packet (Newsgroup): General discussions involving Packet Radio.

rec.radio.amateur.misc (Newsgroup): General amateur radio discussion. Usually does not contain any particular information about Amateur Packet Radio.

rec.radio.amateur.policy (Newsgroup): Discussion of regulation policies regarding every aspect of amateur radio. Occasionally deals with policies of packet coordination and legal issues of packet radio.

rec.radio.swap (Newsgroup): General For-Sale for any radio equipment. Occasionally will have packet equipment for sale. Recommended location for any amateur packet radio for-sale items.

info-hams@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.misc Usenet discussion.

packet-radio@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.packet Usenet discussion.

ham-policy@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.policy Usenet discussion

hs-modem@wb3ffv.ampr.org (Mailing list): Discussion of high speed modems and radios available and future plans. Also includes discussion of networking using high speed modems.

tcp-group@ucsd.edu (Mailing list): Group discussion of technical developments of TCP/IP over packet radio and use of the NOS TCP/IP programs.

gateways@uhm.ampr.org (Mailing list): Discussion of current gateways and future plans for gateways. May deal with sensitive internetworking issues.

listserv@knuth.mtsu.edu has several interesting mailing lists available:

GRAPES-L	Discussions with GRAPES (Georgia Radio Amateur Packet Enthusiasts Society) on 56kb WAN's and the WA4DSY 56kb RF modem that they distribute.
TENNET-L	Tennessee's efforts at a coordinated high-speed RF packet network
GRACILIS-L	Discussions on Gracilis tcp/ip packet equipment. Includes some of the people from Gracilis.
KA9Q-UNIX	Discussions on porting and using various versions of KA9Q Unix/Xenix NET/NOS under any of a variety of Unix/Xenix variants.
TNV-HAMS	General discussions amoung email connected amateur radio operators in and surrounding Tennessee

Send a message with a body of "HELP" to get help from the list server. Also, Internet users may now INTERACTIVELY work with the ListServ there by:

    telnet knuth.mtsu.edu 372

        or

    telnet 161.45.1.1 372

For all lists at ucsd.edu, archives may be found via anonymous FTP at ucsd.edu. Some listserv groups also have archives. Send the command 'help' to the group's listserv for more information. Digest mailings for the ucsd.edu discussions are also available. Send mail to listserv@ucsd.edu with the first line being 'longindex' for more information.

Terry Stader (KA8SCP) <tstader@aol.com> maintains a list of Mac packet-related software, and posts it periodically (somewhat less often than monthly) to rec.radio.amateur.packet.

2.2 What anonymous FTP sites are available for getting packet radio information and programs?

This is a sampling of FTP sites that carry amateur packet radio related files. Consult the Archie archive server for info on locating particular files. For more information on using archie, send mail to archie@cs.mcgill.edu with the line 'help'.

ucsd.edu

Primary distribution site of KA9Q's derived TCP/IP packages. Also, general packet radio information in the /hamradio/packet subdirectory.

wsmr-simtel20.army.mil

Very large collection of amateur radio software.

wuarchive.wustl.edu

Mirror site of Simtel20 archives. Unix directory structure, which is easier to use then the simtel20 archive.

ftp.cs.buffalo.edu

Supplimental archive site for amateur radio information. Contains current copies of all rec.radio.amatuer.* FAQ's.

tomcat.gsfc.nasa.gov

Packet software including Baycomm, ROSE, G8BPQ, NOS, etc.

akutaktak.andrew.cmu.edu

SoftKiss for the Mac, in /aw0g. Requires NET/Mac.
SoftKiss is an init/cdev/driver that allows a MAC to do packet using a Poor Man's Packet modem.

sumex-aim.stanford.edu

NET/Mac is the port of KA9Q's NET program. It doesn't have nifty features like scrolling or saving the windows, but the individual sessions can be recorded into a file.

2.3 How do I contact the ARRL via electronic mail?

There are various addresses at ARRL HQ, but the most important one is probably info@arrl.org. That is where general information about the ARRL can be acquired. This address reaches a person, so you'll have to specify what/who you're looking for.

2.4 Are there any gateways for mail or news between Internet and Amateur Packet radio?

Internet / Packet Radio BBS Gateway

Jim Durham, W2XO, maintains a gateway between Internet and the Packet radio BBS system.

To mail from Internet to Packet:

1. Mail to: "bbs@w2xo.pgh.pa.us"

2. Make the first line of the text a Packet BBS "send" command, ie: SP TOCALL @ BBSCALL.ROUTING-HINTS < FROMCALL

3. The "subject" line of the Internet mail becomes the "title" line of the Packet BBS mail.

NOTE: Because of FCC regulations, Jim must hand filter each message sent FROM Internet TO the Amateur Packet Radio BBS system. Messages should be of minimal length and appropriate content. Read Section 1.9 (Do's and Don'ts: Rules and Regulations) regarding appropriate usage of packet radio for more information. Always include the routing hints with the BBS callsign.

To mail from Packet to Internet:

1. The amateur radio operator must have his callsign registered in the gateway alias list. If you want to mail from packet to a specific amateur on Internet, send mail to 'durham@w2xo.pgh.pa.us' (Internet) or 'W2XO @ W2XO.#WPA.PA.USA.NOAM' (Packet BBS mail) with his/her amateur callsign and their Internet address.

2. Once the above is accomplished, packet BBS mail should be sent to 'CALL @ W2XO.#WPA.PA.USA.NOAM'. The mail will automatically be forwarded to the Internet address of the amateur with the 'CALL' callsign.

Jim Durham's Internet address is 'durham@w2xo.pgh.pa.us'.

LAN Gateways (Packet wormholes via Internet)

Currently a group of amateurs are experimenting with connecting packet LANs together via Internet IP inside IP Encapsulation. Some of the gateways only accept TCP/IP packets, others AX.25 packets. These gateways uses the Internet as a transport medium, thus it is impossible to access the packet radio network from Internet. For more information, join the Gateways mailing list by sending mail to "gateways-request@uhm.ampr.org".

3 Networking and special packet protocols

This is a sample of some of the more popular networking schemes available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.

3.1 Are there any other protocols in use other than AX.25?

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.

Often, special packet radio protocols are encapsulated within AX.25 packet frames. This is done to insure compliance with regulations requiring packet radio transmissions to be in the form of AX.25. However, details of AX.25 encapsulation rules vary from country to country.

3.2 What is TCP/IP?

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different computers such as the Amiga, Macintosh, Unix, and others. Smaller computers like the Commodore 64 and the Timex-Sinclar do not currently have version of NOS available.

3.3 Networking Schemes

What are some of those other networking schemes?

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network schemes where created.

Digipeaters

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if its call was in the digipeater field, would resend the packet. Digipeaters allow the

extension of range of a transmitter by retransmitting any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.

KA-Nodes

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgement, KA-Nodes allow for more reliable connections with fewer timeouts, because acknowledgments are only carried on one link. KA-Nodes therefore are more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.

NET/ROM

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM station as if connecting to any other packet station. From there, he can issue commands to instruct the station to connect to another user locally or connect to another NET/ROM station. This connect, then connect again, means that to a user's TNC, you are connected to a local station only and its transmissions do not have to be digipeated over the entire network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM doesn't use all of the AX.25 protocol. Instead, it uses special AX.25 packets called Unnumbered Information (UI) packets and then puts its own special protocol on top of AX.25. This is again used to increase efficiency of its transmissions.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, MSYS, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network. However, if band conditions such as ducting occur, ordinarily unreachable nodes can be entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route to a distant node manually defining

each hop instead of using the automatic routing feature.

ROSE

ROSE is another networking protocol derived from X.25. Each ROSE node has a static list of the nodes it can reach. For a user to use a ROSE switch, he issues a connect with the destination station and in the digipeater field places the call of the local rose switch and the distant rose switch the destination station can hear. Other then that, the network is completely transparent to the user.

ROSE's use of static routing tables ensures that ROSE nodes don't attempt to route packets through links that aren't reliably reachable, as NET/ROM nodes often do. However, ROSE suffers from the inability to automatically update its routing tables as new nodes come online. The operators must manually update the routing tables, which is why ROSE networks require more maintainance.

3.4 BBS message transfer

Many of the BBS programs used in packet radio allow for mail and bulletins to be transferred over the packet radio network. The BBSes use a special forwarding protocol developed originally by Hank Oredsen, W0RLI.

Besides full service BBSes, many TNC makers have developed Personal BBS software to allow full service BBSes to forward mail directly to the amateur's TNC. This allows operators to receive packet mail at night and avoid tying up the network during busy hours.

I am working with a Tiny-2 MK-2 in the KISS mode (with G8BPQ 4.06e) with
my packet cluster node. This TNC is the backbone link. The other TNC
running with KISS (KAM) has run flawlessly during the last month. The
Tiny-2 occasionly goes "dead" and fails to take commands without being
cleared from KISS and reset. On several occasions, with the computer
running, I found the STA light glowing (this same thing would occur
if the computer would be turned OFF with the PacComm turned ON). Again
the unit required reseting. Here is the final insult: I have 3
computers here, 486-50, 386-40 and a laptop. The 486 started out running
the PacComm quite well for about 3 weeks, with occasional failures. One
day, it stopped taking commands and eventually failed to "talk" with the
unit any longer. Random characters are seen to show up on the screen
with the 486 connected to the Tiny-2 while in Procomm Dumb Terminal mode.
The character is generally a ":". The Tiny will not respond to that
computer, but if I disconnect the serial line and connect it to my laptop
the random characters disappear and that computer can reset the Tiny-2
and it runs quite normally. I changed the SERIAL card in the 486, thinking
that the problem was there, and ramdom characters still appear. I ran
QAPLUS, no identifiable COM errors. I started to run the "Cluster" with
the second computer (386-40). You guessed it. Started out fine, but
within hours, the Tiny-2 stopped taking commands. A few resets later
and now the 386-40 has become flaky and shows random characters in
the dumb terminal connects to the Tiny-2 (random characters that before
were DEFINITELY not there). PacComm tells me there is a new version
of their factory EPROM and have sent it to me. I have not received it
in over a week. Their people tell me to send the Tiny-2 back, but
I wonder if anyone can steer me with any experience on this matteror
can refer this posting to the proper persons.
Thanks, Dave KN2M

Subject: TNC Baycom source in Europe?
Lines: 10

I am looking for a source of ready made TNC and Baycom and other
modems. My University wants to buy it everything set up ready.
I prefeer a vendor in Austria or Germany, bur every other European
source would be ok. Please write me your expirience with the vendor,

the modem and the price.

I am also looking for plans to build modems. I allready got one from the
Baycom type.

Thank you in advance

I have already received four E-mail replies since I posted this article
yesterday. (Thank you for your replies.) As a result, I realize that
I was broad in stating my query.

Calling some time-standards organization is a solution. There are programs
available for the Amiga which will automatically do this. However, I was
looking more for a broadcast solution.

Additionally, it would have to be a broadcast solution receiveable in the
Ogden, UT area. (Though regional time-signals would make it into any summary
that I would make.) I would also like to know what (additional) equipment
would be necessary to receive and interpret the signal(s). (I did receive
some replies along these lines to which I will be replying.)

I will summarize on the Net if there is sufficient interest. (Send me a
"Me too" message to be counted.) If there isn't sufficient interest, I'll
summarize via E-mail.

Jeff Austen, k9ja, wonders if anybody has done this already.

Short:
  Yup. Works. Don't forget the clock option.

Long:
  With the agreement of the local repeater co-ordination body, and
  lstely the local packet working group, I've established a 9600 bps
  repeater. Call is ve3gsd; frequency is 444.45 MHz +.

  Packet part of the repeater is based on a completely stand-alone
  TAPR modem with both bit regen and clock options. Had a devil of a
  time getting it to work the first time, due to a bum U13 PLD. Audio
  is shared between the voice part of the repeater and the modem.
  Voice controller will take care of the IDer. Legal issues are less
  of an issue in Canada: bandwidth for the band? Licence and class?
  Ride on McDuff!

The next meeting of the Radio Amateur Telecommunications Society (RATS)
will be Thursday evening, May 13th, at the Wendy's restaraunt (yes,
Wendy's!) on Route 46 West in Little Falls, NJ. People begin to arrive
abut 6:30 PM, and the program begins at 7:45 PM. Informal talk-in is on
the 145.190 MHz (-600) N2DSY repeater in Little Falls.

This month's topic:

    Setting-up a ROSE Switch

We will discuss and demonstrate what is required to have a ROSE Switch
of your own. This presentation will cover hardware and software
considerations, basic network design, configuration, and more.

This hands-on presentation should be of interest to evryone from
relative beginners to experienced packet operators. Attendees will
leave the meeting with a better understanding of how ROSE X.25 Packet
Networks operate, as well as the ability to either add a Swtich of their
own to an existing network or begin a network of their own.

For more information send a message to:

        packet: askrat@kb4cyc.ny.usa.na

Is anyone working on a device driver for SVR3.2/4.0 for ax25?? I have
some code written for the sun system (by ve6uug) but it is missing ax.h
and it is a few years old.

Has work on this or other drivers continued?? My main interest is in
a streams device driver and not a hack of ka9q NET/NOS since unix
has all the TCP/IP programs.

Tnx Tom ka9qpg/g7ogu

Hi,

I search the patch between the NET/MAC 2.3.17 to NET/MAC 2.3.18.
The actual version is 2.3.21. I have Net/Mac 2.3.16 with upgrade to 2.3.17.
I have also Net/Mac patches from 2.3.18 to 2.3.19, from 2.3.19 to 2.3.20,
from 2.3.20
to 2.3.21 but I don't have the patch for Net/Mac 2.3.17 to 2.3.18.
Could someone help me to download this patch or the final version (2.3.21).

I need some help about some release of Net/Mac.
I see from pa2aga a program called Net/Mac 2.2.
I see also Net/Mac 2.3.X. (where X=15 to 21)
Wich are the differencies and the last release?

Many thanks.

Does anyone know (and be willing to share) where I can FTP
a copy of the latest BPQ? I think its ver 4.06a.

Thanks

Roland

Hello,
   I'm looking for a low-cost mac packet station.
  I've seen plans in 73 magazine for a low cost mac
  software/hardware TNC. It cost about $30.

  Has anyone used such a system on the mac? If so
  how did you like it, would you do it again? What
  software do you recomend to use? I'm interested
   in 2m packet.

  Pointers to information are also welcome.

 Thanks,
   -Jeff

I built a Baycom modem and use it with my Macintosh. The software I
use is a combination of SoftKiss1.6 which converts the Baycom data
to KISS mode, and Net/MAC, the ka9q software for Macintosh. It
works great. Both pieces of software available for ftp on the
network (I think they are on ucsd.edu, someone correct me if
wrong).

For the past five or so years I have been using the W0RLI BBS software but
am now researching what else is available. I have FTP'd the latest copies

of F6FBB, W0RLI, and AA4RE and have studied the document files. I would
like to FTP the latest version (1.14?) of MSYS. Can anyone tell me where
to find it?

This is release V7.02f of the C-BBS packet BBS for the Amiga computer.
I found the problem which was causing compressed files sent to FBB to be garbled
if they were more than about 2Kb long. This release fixes that problem so that

you can now use FBB compression without restriction.

     I have a powerbook 100 and an Alinco DJ-F1T. I want to find the
cheapest and smallest method of doing packet I can find. Some soldering is
OK. I am wondering if there is a packet modem that will fit in the modem slot
on my powerbook. If not the smaller the better. Also what kind of software
do I need for Mac Packet and is there Remote Access type software for Packet.

                         Thanks,

> The nonsense here is of my own making - no one else would want credit!

I have created serveral programs for use with j-Com's HAMBASE callbook.

The first collection of servers (HBSERV29.EXE) run within FBB and require the hambase 2.62 retrieval program (the 3.0 data WILL work with the older server). The Hambase 3.01 program is just too big to run within the FBB program. This collection features a program to allow users to lookup callsigns form the BBS command line and a program that processes messages to an alias such as HB as soon as they are receive and then formulates a reply that is usually imported into the BBS as a message seconds after the server is done processing the message.

The second server (REQ3HB.EXE) is for the HAMBASE 3.01 retrieval program for use in a mutlitasking enviornment such as DesqView. This server is made to be flexible. For example: If you have 2 computers connected by a lantastics type system you may dedicate one computer to the BBS and run the server on the second computer in the background (it would be a waste of a computer to use this server without a multitasking enviornment). With this type of server all HamBase lookup requests will be forwarded to a file to be processed by the server. Unfortunately this server is not as fast as the first. I advise if you have the old 2.62 hambase program use it. The first server is much faster and supports callsign lookup immediately from the FBB command line.

Both servers will handle the regular Hambase data, county data, DX QSL managers, & Russian callbook/DX data. I plan to add support for the packet home BBS data as soon as I receive the disk (it is taking forever) and have time to play with it.

Unfortunately, I have not been able to put these programs on a FTP site because of mysterious difficulties I am having uploading the files to my VAX/VMS host.

I do have a FBB system with a modem port configured for read-only access (712) 732-3767 (dedicated data line).
The servers may be found in the \servers directory as HBSERV29.EXE and REQ3HB.EXE. To download the programs you enter your callsign at the prompt and then enter Y for read-only access. Type D to enter FBB-DOS, then enter CD\SERVERS. Enter XGET HBSERV29.EXE or XGET REQ3HB.EXE to get the appropriate file. For those with PKZIP 2.04* I will place a .ZIP of each of the archives to save you download time (23K & 12K compared to 38K & 27K).

BTW I do have a VERY primitive version of the server on FTP.FUNET.FI in the /pub/ham/packet/bbs/f6fbb/util directory under the name of hbservrs.zip. This would get Hambase on line incase my number is busy or if a family member happens to disconnect the telephone cord without my knowledge (yes, it has happened!)

For the record: these programs are "freeware". You may download them and upload them as you wish. Just please do not alter the archive. It has all .DOC and config file examples and would be rather useless if any of them "got lost". I posted this instead of just using E-mail because I am sure there are others desiring to use Hambase with the FBB BBS.

I hope these programs will be of use.
73,
Dean - KE0WO

It sounds like the Mac Packet Modem, as featured in 73 magazine (last October?) will
do the trick for you. I bought the kit for $30 and put it into a 3x2x1" radio shack
box. It hooks up to the modem port and I put the connectors for my Icom

HT on the
other side. Looks like a bump in the cable. Also, the modem gets its
power from
the serial port, so no extra power cable is required. Even comes with a
Hypercard
stack showing details of assembly and calibration. Send me email is you
need more
info...

Subject: Getting onto the PACSATs and 9600 baud packet?
Message-ID: <1993Apr30.045850.18489@nntpd2.cxo.dec.com>
Sender: usenet@nntpd2.cxo.dec.com (USENET News System)

Lines: 24

I'm looking for suggestions or advice on getting onto the PACSAT's and
local 9600 baud packet operation. Here is the "stuff" I have:

2 MFJ-1278
1 TAPR TNC 1
Yaesu FT-726R
Yaesu FT-727
Microwave Modules MMT 28-432 Transverter

Kenwoods TS-820S
Uniden 2510
Yaesu FT-290 MK II
SSB and Tokyo Hi Power 2m and 70cm preamps
KLM short crossed yagis

Can I use any of this "stuff" to get onto the PACSATs? What else do I need? I ask because I have heard of problems with the ability to get the radio to handle 9600 baud data and the TNCs handling all the PACSAT packets in real time. What modem(s?) do I need?

Thanks for any and all help you can provide.

73,
Todd

I'm in the market for a DPSK 2400 baud modem for my AEA PK232MBX. I've just gone through a total nightmare with AEA attempting to get a functioning modem board from them, with no luck whatsoever.

Their board has a chronic heat problem and they do not feel that they can resolve it, so it looks like I will be sending it back. Also, their design is not compatible with the TAPR DCD mod.

What other modems are available? My PK232 has the TAPR modem disconnect already installed, so interfacing shouldn't be a problem, assuming that the modem has the TAPR standard interface.

All ideas, suggestions, experiences, etc. welcome. Responses preferred direct to p00123@psilink.com but posting here is also ok.

Hi,
  I am looking for the issue that had an article in it about using packet
  for emergency communications in Colorado. If you know what month and
  or the title of the article, I would appreciate hearing form you.

  Thanks,

Shareware RTTY/FAX Decoding Programs for the IBM PC

Frequently Asked Questions

by Dave Moisan, N1KGH

Last Revised--30 April 1993

Many people have gotten interested in receiving RTTY and FAX transmissions with their PC's. Shareware, combined with cheap, easy-to-build hardware, has put RTTY and FAX reception in reach of anyone with a good digital portable such as the Radio Shack DX440 or Sony 2010.

Two programs have become very popular: Hamcom 2.1, a RTTY terminal program, and JVFAX 5.1, a full-featured FAX/SSTV receive program. The two programs both use an identical basic interface, so one can get started in FAX and RTTY for almost nothing. Another program, PKTMON, lets you monitor HF and VHF packet off the air, using the same

hardware.

This FAQ list is divided into five sections:

        Introduction
        Using HamComm
        Using JVFAX
        Using PKTMON
        General Problems

        Appendix--HamComm Interface Schematic and Parts List

INTRODUCTION

** Where do I get the software?

  HamComm and JVFAX are available from a number of sources on the
  Internet, including simtel20.army.mil and nic.funet.fi
  (/pub/ham/misc); look for HAMCOM21.ZIP and JVFAX51.ZIP.
  PKTMON 1.2 is available from nic.funet.fi and should be on
  Simtel as I post this.

** What are the basic system requirements?

  HamComm: XT or better, 320K RAM, hard disk not required.

  JVFAX: 286 or better, at least 1M RAM; a hard disk is
            strongly recommended. Note that JVFAX has its
            own extended memory driver, which may conflict
            with HIMEM.SYS and other memory drivers.

  Pktmon: 286 or better.

** What are the basic receiver requirements?

  I've successfully received RTTY, fax and Packet with my
  Radio Shack DX400 digital portable, and have had less
  luck with CW. Receivers like that will work, but table
  top radios (Kenwood, Icom and Yaesu) and ham transceivers
  are much more suited for this application.

** Where can I find plans for the basic interface?

  The plans are included in the documentation for both Hamcom and
  JVFAX. JVFAX has schematics for both the basic interface, and
  a more sophisticated interface that also receives GOES/APT
  satellite pictures.

  A complete schematic and parts list is included at the end
  of this FAQ list.

** I don't want to build it. Can I buy a interface?

  Yes. William Nolle is selling his version of the interface,
  called FAXCAP, and it includes all software discussed here.
  Contact him at:

     William Nolle
     122 Phillips Rd
     Hazel Green, AL 35750

  (Disclaimer: I am not affliated with William, nor am I even
   a customer, but merely a friend and fellow enthusiast.)

  Also, Dieter Dippel is selling an interface (with surface-
  mount components) which includes JVFAX and HamComm. Contact:

     Dieter Dippel
     Fenitzer Str. 33
     D-8500 Nuernberg
     Germany

** How does the interface work?

  This is a zero-crossing detection circuit, made up of a 741
  connected in an open-loop configuration.   For every zero-
  crossing (twice a cycle), an interrupt is generated.
  HamComm measures the time between successive interrupts using
  the PC timer chip.

** How do I connect it to my radio?

  Simply run an audio cable from the interface box to the earphone/
  headset output, record output, or data output of your radio. The
  Sangean 803A has a record output, and the DX440 can be modified for
  same. Note that the interface needs 100 mV of audio to work,
  but most rigs can easily supply this.

** Can you transmit with the interface?

  Depends on the software, and how you construct the interface.
  Hamcomm will send through the speaker or TxD line of the serial
  port; JVFAX sends through the speaker. Pktmon doesn't transmit
  at all. See the appendix for details.

USING HAMCOMM

** How do I set up HamComm?

  There's a sample configuration file in the HamComm archive, HC.CFG
  which explains the numerous parameters required for the program
  to run. Here are the ones you should set:

select port com<n> (Select default com port, <n=1 to 4>)

Note: COM1 and COM2 are already defined. If you need to use COM3 or COM4, here are the "define port" statements to use:

```
define port com3  iobase 0x3e8  irq 4
define port com4  iobase 0x2e8  irq 3
```

You don't need to do this for COM1 or COM2 unless you have an unusal setup.

** Where can I find RTTY on HF and what does it sound like?

The ham bands are the best place to find decodable RTTY. I tune into CFH, Halifax, Nova Scotia on 4271, 6496.5 and 10536 KHz. RTTY is usually sent on the half-hour. RTTY has a "deedle-deedle" sound that you're probably familiar with if you've ever randomly tuned shortwave.

If you want to know what an RTTY signal sounds like, go to the RTTY screen (F3) and try control-T (transmit on/off). Type in some text and hit ENTER. You will hear a signal from the PC speaker according to the currently selected speed, shift and center frequency.

** How do I tune RTTY?

First, hit F9 for the tuning screen and, using the arrow keys, set the center frequency to 1200 Hz. For example, if you're trying to decode the ARRL bulletins on 3625 KHz, the tuning screen should look like this:

```
                    Signal Frequency: 01###  Hz

  0 . . . .500 . . . .1000 . . . .1500 . . . .2000 . . . .2500 Hz
               Space ->   |   |  <- Mark
                          |

                    Center Frequency: 01200 Hz
```

Using the arrow keys, move the lower tuning bar between the two upper tuning bars. You may need to vary your BFO, RIT or clarifier so that the upper bars are centered on the display.

The difference between the two frequencies, or "distance" between the two upper bars is the *shift* of the RTTY signal. Hit Alt-K and select the appropriate shift--in this example, 170 Hz.

You'll know when the signal's tuned properly, because a train of

square waves will appear at the bottom of the screen.

Next, hit Alt-S and select the *speed*; Ham RTTY is usually 45 baud. Outside of the ham bands, 50 and 75 bauds are most common

(Note: If you're mathematically adept, you can figure out the speed yourself. Hit F8 to select the Scope and freeze the display by hitting Return. Measure the time interval of the _shortest_ peak, and calculate Baud rate = 1/t*10**-3, where t is in milliseconds.)

Now, hit F3 (for Baudot), and readable text should scroll forth on the screen. If it doesn't, hit the Tab key to toggle between Normal and Inverted keying. If text is still unreadable, hit Alt-S and adjust the speed.

** How do I log RTTY to a file?

Hit Alt-F R or Alt-F W; select the directory or file you want to save to and hit Return. To stop logging, hit Alt-F R.

Here's some RTTY recorded off the air on 4271 Khz (at 0230 UTC):

avalon peninsula
east coast the bonavista peninsula only.
freezing rain warning continued for the bonavista peninsula only.
tonight..overcast. intermittent drizzle or freezing drizzle.
periods of freezing rainpm yrkwivonavista peninsula ending
overnight. winds becoming strong northerly. low zero.
friday..cloudy. patchy freezing g7+)-01vtov

** Whenever HamComm is receiving a string of numbers (like from CFH or other weather stations), it comes in garbled.

HamComm has a AutoLetter mode that automatically shifts from Figures to Letters after 5 characters have been received. Turn this off with Control-L; the "L" at the bottom right of the display should disappear. This feature is akin to the "Unshift On Space" option found on other decoders.

** I found RTTY, but Hamcom can't decode it.

A sad fact of life in the shortwave bands is that at least 3/4's of all RTTY is encrypted, and alas, much of the unencrypted traffic is not sent in plain Baudot. There still are many decodable signals, but you'll need good references to find them.

** How do I decode CW?

Decoding CW is similar to decoding RTTY, except that there's only one frequency to be concerned with. While you hear the CW, go to the decoding screen, as below:

```
                    Signal Frequency: 01200 Hz

  0 . . . .500 . . . .1000 . . . .1500 . . . .2000 . . . .2500  Hz
                               |
                               |

                    Center Frequency: 01200 Hz
```

Just move the arrows so that the lower line is lined up with the upper and hit F2.

Here's a sample of CW copied off the air, on 4281 Khz

```
   vvv vvv vvv cqde vcs vcs vys qsx 4 6 and 8 mhz chnl 3/4/7/8 vvv
   vvv vxv cq de vcs vcs vcs qsx 4 6 and 8 mhz chnl 3/4/7/8 vvv vvv
   vvv cq de vcs vcs vcs qsx 4 6 and 8 mh7 chnl 3/4/7/-.--.. vvv
   vvv vvv cq de vcs vc5 vcs qsx ......- 6 und 8 mhz chnl 3/4/7/8
```

Note that HamComm subsitutes dot-dash marks for any character it can't decode.

** I'm hearing CW, but Hamcom just garbles it.

There are two different problems encountered with CW decoding in HamComm. Here's what Django, DL5YEC, author of HamComm has to say:

Problem 1: Tone detection

For many people it is obvious that an RTTY signal has two states, usually called mark/space or high/low tone. ANY data transmission requires at least two states for 1 bit at a time and CW is no exception. So what are the two states for CW? They are the tone and ... NOISE ! You may be surprised to hear that a certain amount of noise is REQUIRED to detect that the tone has ended.

HamComm has an indicator for the tone detector output. At the bottom of the RX window, just to the right of the WPM display, is a small white dot that jumps up and down: up = tone detected, down = no tone (noise) detected. Listen to the signal and watch the jumping dot. It should follow the signal precisely and not jump around nervously or stick to one position.

The input signal is compared to the currently selected mark/space tones. To be regarded a valid tone the signal has to stay in that range for a certain amount of time. So the behaviour of the detector mainly depends on the currently selected SHIFT.

The tone detector output as displayed by the dot is the input to the character decoder.

Problem 2: Character decoding

In theory a dash is three times as long as a dot, the gaps within a character are dot-sized and the gaps between characters are dash-sized. In reality there are short and long tones and gaps of variable size because CW is usually 'hand-made.' The speed and length ratios also change during a transmission if the operator gets tired.

HamComm keeps a floating average of the tone duration to adjust to speed changes. Overall decoding quality mainly depends on the tone detector.

As an aside, I should mention that the bouncing-dot display also works great for RTTY; just tune the receiver until the dots bounce equally between top and bottom.

USING JVFAX

****** How do I set up JVFAX?

Select "Configuration" from the menu, and you should see a Config screen. Options are set using the arrow keys to select, and the space bar, - or + to set each option. Here are the options you need to set:

Demodulator: Set to "7 bits" and "Comparator/IRQ 4" or "Comparator/IRQ 3". Specify the address according to the following table:

For:	Specify IRQ:	and Address:
COM1	4	03F8
COM2	3	02F8
COM3	4	03E8
COM4	3	02E8

Graphics and SSTV-Graph: Set this as appropriate for your system. Most users can specify "VGA (640x480)". A number of Super VGA cards are supported, but you'll have to refer to your VGA manual for register settings.

Printer: Again, set this as appropriate for your system. Most popular dot matrix printers and the HP Laserjet are supported. (As an example, for my Panasonic 1124, I selected "Epson 24-pin".)

Enable scrolling: This determines whether faxes will scroll off the screen when being received. Set this to "Yes".

Default Picture Directory: Enter the disk and directory where faxes will be stored, e.g. "C:\WEFAX".

Store Pictures in GIF 89a: JVFAX uses the GIF 89a standard to store special information on each fax, such as mode, LPM and IOC. Unless you're using other GIF software that can't handle this standard, leave this enabled ("Yes").

Miscellaneous Settings: Hit Esc to enter yet another configuration menu! There are just two settings you need to make:

Quicksave: This feature lets you save the last picture sent; it works by continuously capturing faxes to a .GIF file, which may become *very* large. Unless you have lots of hard disk space, set this "off".

Initial RX Mode: Set to "1--Wefax 576"; this is the mode that almost all weather faxes are sent in.

Hit Ctrl-Enter to leave this menu. Hit Ctrl-Enter again, and you're done!

** Where do I find fax and what does it sound like?

A Fax signal will have a "scratchy wheel" sound when sending a picture, and a carrier tone when idle. It can be found easily in the maritime bands. Unlike RTTY, there are few variations, and no transmissions are encrypted that I know of.

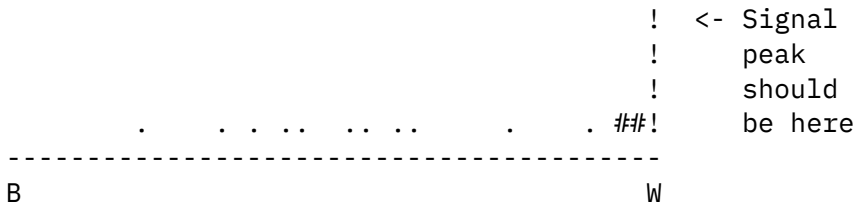
Two stations I hear regularly on the US East Coast are NAM, Norfolk, VA on 3356, 8080 (irregular) and 10865 KHz, and CFH, Halifax, NS on 4271, 6496.5 and 10536. CFH sends faxes on the hour, generally. I've found press fax on 9244, from Buenos Aires, Argentina.

** What modes are faxes usually sent in?

Weather faxes are usually sent with an IOC (Index of Correlation--the ratio of width to height) of 576, and an LPM (Lines Per Minute) of 120. Press faxes, the few I have found, use an IOC of 288 and an LPM of 60.

** OK, I'm hearing it. How do I tune in?

Using NAM, 10865 KHz as an example, follow these steps:



1) From the JVFAX main menu, hit F (Fax), and you'll be shown a blank screen with a tuning indicator and a menu box on the bottom of the screen.

2) Select the mode by hitting 1 ("Wefax 576").

3) Set the deviation to 400 by hitting the D key till it comes up.

4) Using your BFO, RIT or clarifier, tune the signal (in lower

sideband) until you see a peak on the tuning indicator. Tune this peak towards the W (white) end of the scale (This will normally be 1.9 Khz below the center frequency, in this case 10863.1 Khz.) The indicator should look like this:

5) Hit A (APT); it should read "Running" and you should start to see a fax appear on the screen! To stop recieving, hit A again.

** I don't get a fax, or I get something garbled.

Check the mode; most fax transmissions use "Wefax 576", mode 1 in the program. The LPM should be 120. Check your connections to the interface. If that's in order, you may have an RFI or interrupt problem (see questions in "General Problems").

** I get a fax, but it comes out slanted.

Hit / and a line will appear; use the arrow keys to tilt and move the line so that it's lined up with a line on the fax (such as a border or a chart line). Hit Return, and the fax should now come in straight. Note that this is a permanent adjustment, and you shouldn't need to fix this ever again, no matter what faxes you subsequently receive.

** I get a fax, but it's not aligned with the edge of the screen.

Hit R (Rotate) and move a line with the arrow keys to the left edge of the fax (there'll be a black bar where the fax is supposed to start.) Hit Return and the fax should now be properly aligned.

** My fax is negative!

You're receiving the fax on the wrong sideband; try the other sideband. Most faxes will be sent in LSB. A few press stations transmit negative pictures (JVFAX can be set to fix this; see the docs.)

** My fax is too dark.
My fax is too light.

Your receiver is mistuned. If the fax is too dark, tune towards the white end of the tuning scale (peak moves towards W). If the fax is too light (washed out), tune towards the black end of the tuning scale (peak moves towards B).

Also, make sure the deviation is set correctly, at 400 for most faxes. This is especially important for receiving the GOES satellite images that NAM sends.

** How do I save a fax to disk?

While you're not receiving a fax (APT "waiting"), the S key will toggle the save-file option on and off. Faxes will be saved in .GIF format to the disk and subdirectory you specified in the configuration screen.

** How do I print a fax?

Two ways:

1) While you're in the fax receive mode and not receiving a fax (APT "waiting"), P will enable your printer; it's a toggle, so hit P again to disable printing.

   NOTE: You cannot have both Save to File and Print options enabled at once. Also, once the fax is printing, the Rotate command will not work on the printout.

2) Hit H (Show and Send Pictures). Select the fax you want to print. When it appears on the screen, hit P. JVFAX will ask how much width it will print in (0-100%); hit Return for the default (100%).

** The GIFs I save are too big! How do I shrink them?

It's not uncommon for weather faxes to be very large, especially if you regularly pick up 16-shade GOES images over NAM (a recent GOES fax from them "weighed in" at 870k!)

There are several methods you can use to shrink the size of your GIFs:

1) You can crop them. From the main menu select H (Show and Send Pictures); from the directory listing, select the file you want to crop. The fax will show up on the screen--select the Z (Zoom) option. Use the arrow keys to move the zoom box (which is about the size of a regular 640x480 VGA screen), and the X, Y, + and - keys to resize it. Hit Return and the cropped image will fill the screen. Hit S to save it (under a different name.)

2) You can reduce the resolution on faxes to be received. Most faxes (of the Wefax 576 variety) have a resolution of 1810x 1000, which makes for beautiful printouts, but is overkill if

you're just using a GIF viewer.

To fix this, go into the Mode Editor (M from the main menu) and select the mode you normally use (e.g. Wefax 576). Step through the options with the arrow keys and select Resolution. For Wefax 576, it'll normally be 1810. Enter a smaller value (800 is OK) and hit Return.

If you're only interested in charts and not satellite images, select the Grays option and set the number of shades to 2 (B&W only--no gray scale). Your GIFs should be much smaller, though at a significant loss of resolution. (That being said, I once saved some GOES images from NAM for a friend of mine in 800x600x4 and they still looked good.)

** I get an all-white/all-black signal, no matter what signal is coming in on the receiver.

Either your audio cable to the interface is broken, or you have an interrupt conflict between serial ports. If it's the latter you may need to move the interface to another port. Note that MSDOS's HIMEM.SYS may conflict with JVFAX. (At least it does on my setup [286, 1M, DOS 5.0]) (See "General Problems" for more on this.)

USING PKTMON

Unlike HamComm and JVFAX, Pktmon has few options and is simpler in scope. Using the same interface, Pktmon will decode HF and VHF packet. Pktmon can log to a file, and will optionally keep track of packets, assembling them into separate files for you. Note that the program is receive-only.

While it will never approach, let alone replace, Baycom or a TNC, I've been delighted with its very ingenious attempt at implementing AX.25 in software, and have found it a surprisingly fair performer. It even comes with source code (Turbo Pascal) for implementing your own projects with the interface!

There isn't much to running Pktmon, so here's a quick rundown through the prompts.

"COM 1 or 2?"	Self-explanatory. Pktmon doesn't support COM3 or COM4.
"Packet type?"	Enter 1 for HF packet or 2 or 3 for VHF packet. I've never noticed a difference between the latter two options in use.
"Log bad packets?"	If you answer Y, packets with CRC errors will printed, otherwise, not. I usually choose to

log them.

"File to log all packets"

Self-explanatory. If you don't specify a file, packets will go on the screen.

"File to log sorted packets"

Enter a filename, _no extension_. Pktmon will sort packets to the files <n:filename.#>, #= 0 to 9. It also creates a file <n:filename.OTH> for uncategorized packets such as beacons.

That's it. Pktmon will start decoding packets until you hit Return. There's a tuning indicator on the top of the screen that indicates activity. Here are some sample unsorted packets copied off the air on 14099 Khz around 2300:

```
 Started Logging on 1993-04-16 at 18:00:11
 [...]
 18:03:00 => CQ    -0  WA2GGI-0    Ctrl:03 [UnAck Info] Pid:F0
  Data: #0D
 18:03:11 => K4YPE -0  WA2GGI-0R   Ctrl:73
 18:03:13 => K4YPE -0R WA2GGI-0    Ctrl:00 [Data, seq 0] Pid:F0
 Data: **HI BOB IN BOCA RATON FL.BUSY NOW PLEASE LEAVE MESSAGE
 ON MAILBOX TNX.#0D
 18:03:23 => K4YPE -0R WA2GGI-0    Ctrl:04 [Data, seq 2] Pid:F0
 Data: ,RM,S, or Help >#0D
 18:03:35 => K4YPE -0  WA2GGI-0R   Ctrl:73
 18:03:38 => KB7HJM-0  WA2GGI-0    Ctrl:63
 18:03:41 => KB7HJM-0  WA2GGI-0    Ctrl:00 [Data, seq 0] Pid:F0
 Data: **HI BOB IN BOCA RATON FL.BUSY NOW PLEASE LEAVE MESSAGE ON
 MAILBOX TNX.#0D
 [...]
 82 total frames received and 6 good ones + 3 CRC errors
 Stopped logging on 1993-04-16 at 18:20:42
```

It's rather like reading the news on an RS232 service monitor, isn't it? :) Note that control characters are depicted as "#cc".

Now, here are some sorted packets:

```
 ****** File open at 18:03:16 on 1993-04-16 for
 WA2GGI-0 => K4YPE -0 traffic

 **HI BOB IN BOCA RATON FL.BUSY NOW PLEASE LEAVE MESSAGE ON MAILBOX
 TNX.  [1 lost pkts] ,RM,S, or Help >

 ****** File open at 18:13:28 on 1993-04-16
 for KC4FS -0 => W1DXQ -0 traffic
```

```
 Phone call Jack. Please wait...

 ****** connection inactive for 5 minutes
```

Now, the questions:

** Where do I find packet and what does it sound like?

  On HF, packet can be found mainly at the lower end of 20 meters
  (14090-14150 usually) and in the 30 meter band (10100-10150 Khz).
  VHF packet can be found on 145.01, 145.03, 145.05, 145.07 and
  145.09, among other places. It has a "braaaap..." sound quite
  unlike RTTY.

** How do you tune in packets on HF?

  On the upper edge of the screen, there's an "A" scale. While
  hearing packets, tune VERY carefully until the scale reads 6 or
  higher. Pktmon expects a tone frequency of about 1000 Hz.

** I'm logging sorted packets, but they're missing linefeeds.

  You'll have to go into your favorite ASCII word processor and
  have it insert linefeeds. I usually copy all the <n:filename.#>
  files into a single file and fix it there.

** I'm getting lots of CRC errors.

  On HF, this is, sadly, normal. Packet is just not well suited
  to a ever-changing ionosphere, and it's marvelous that it works
  at all. (When I copied the sample text, the ionosphere was
  very quiet, an unusual occurence as I'm writing this.)

  On VHF, on the other hand, CRC errors may be a result of Pktmon
  being unable to keep up with transmission. 1200 baud is near
  the limit for this type of interface. I've also found that with
  my setup (in an apartment), I seem to be prone to multipath
  and other VHF anomalies that disrupt reception, especially
  of packet.

** The program locks up on me when receiving lots of packets!

  If there's too much activity on the air, or the receiving tone
  frequency is too high, Pktmon tends to lock up, as it can't
  "follow" the signals fast enough. This has been reported by
  several users on Fidonet.

  According to the author, Pawel Jalocha, if Pktmon takes a long
  time to terminate upon hitting Return, your machine may be
  too slow.

GENERAL PROBLEMS

** Can I use EMM386/QEMM or other memory managers with HC, JVFAX or PKTMON?

Generally, no. HamComm, JVFAX and PKTMON are interrupt-intensive and use up most of the CPU cycles. That's the price you pay for having the demodulation and decoding done in software (rather than in a TNC). JVFAX comes with its own memory manager, anyway.

Note: JVFAX may not work with MSDOS's HIMEM.SYS. You may need to remove the "DEVICE=HIMEM.SYS" and "DOS=HIGH" statements from your CONFIG.SYS before using JVFAX. I've not seen any problems with HIMEM and HamComm or Pktmon.

If you regularly use EMM drivers, Windows or Desqview, make up a minimal boot disk disabling all such programs, before running HamComm, JVFAX or PKTMON.

** I get noise from my computer--HELP!

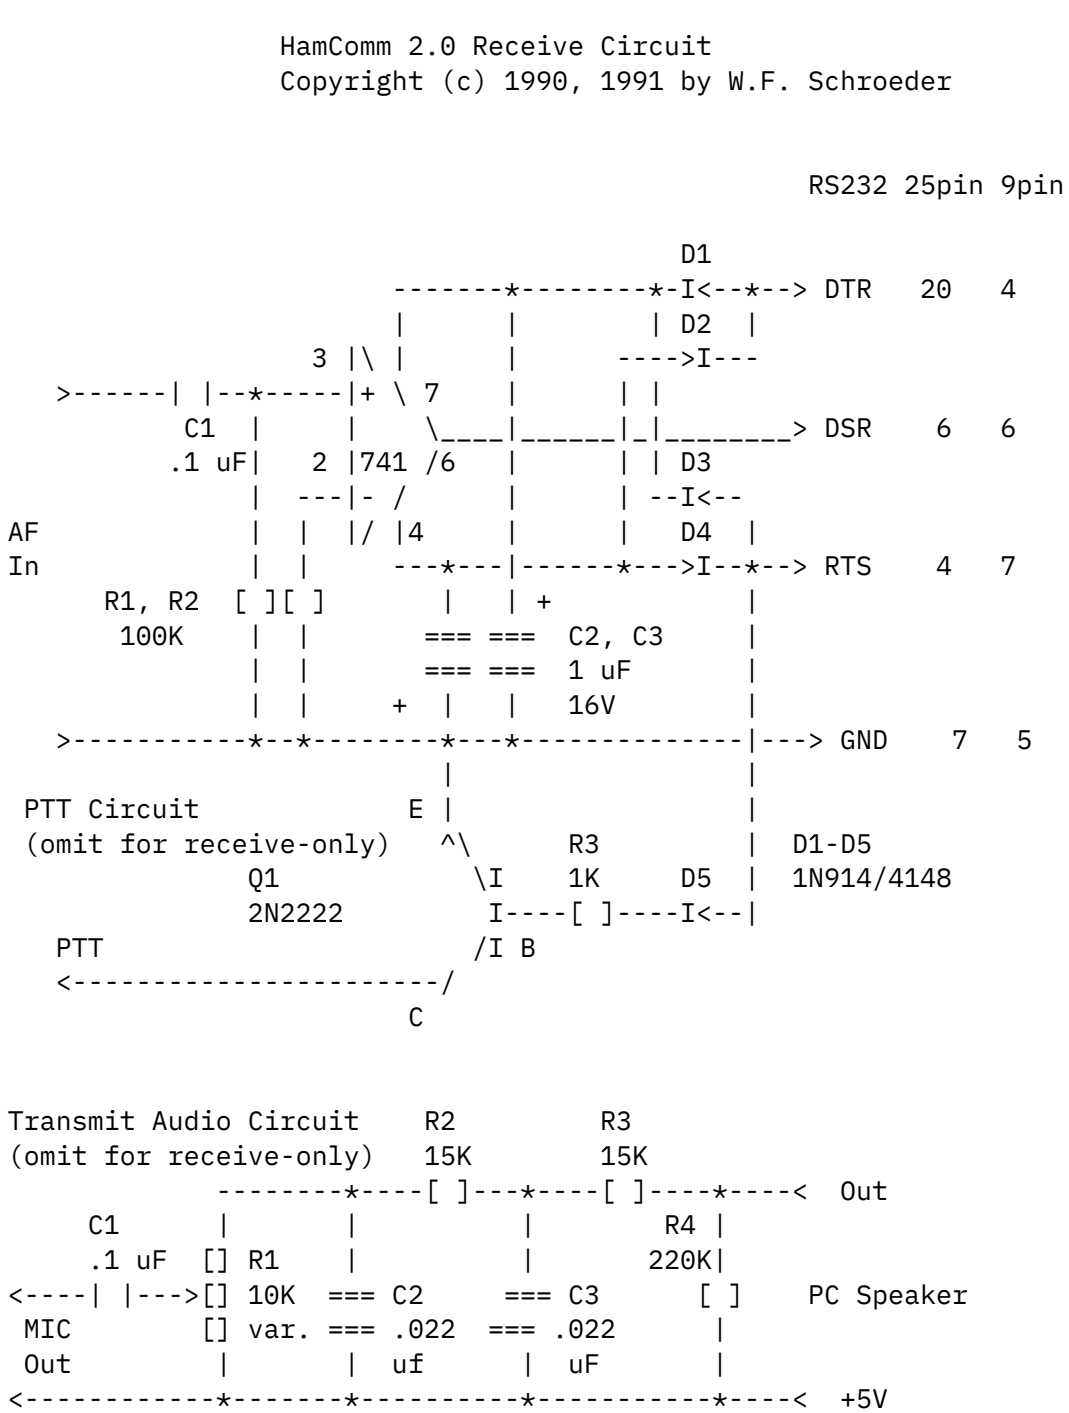
One of the most difficult problems in linking the PC with the radio is RFI. It's beyond the scope of this FAQ list to cover every possible contingency, but here are some suggestions:

1) Keep your computer and your antenna *well* separated from each other and use good, well-shielded, coax for the lead-in.

2) The HamComm interface should be *shielded*--use a metal or foil-lined box. Use good shielded cable for both the audio and data connections.

3) Use RFI toroids (available at Radio Shack) on all cables.

4) Install 0.1 uF capacitors from the DTR and RTS lines to ground.



5) Install an audio isolation transformer between HamComm and the radio. (Radio Shack #273-1374).

6) Make sure the monitor, printer and their connecting cables are well shielded. Monitor noise is very common, as is printer noise.

In my case, I had to do all of those steps. My 286 PC was feeding RFI back through the earphone jack of my radio), *desensing* it (ouch!) I never got all the RFI out, but I reduced it considerably so that I only get a slight increase in background noise on a few frequencies.

APPENDIX -- THE HAMCOMM INTERFACE SCHEMATIC

Here's a schematic of the HamComm interface, reproduced with permission:

NOTE: HamComm sends RTTY through the COM port's TxD line, as well as the speaker. See the HamComm docs for more details.

If you're just interested in receive, omit the PTT and transmit audio circuitry.

None of the parts are critical, so raid your junkbox! Prices for

equivalent Radio Shack parts are given for reference--which you can beat by judicious shopping/scrounging.

Parts List -- Main Circuit

Part	Value	Radio Shack #	Price (1993)
C1	0.1 uF	272-135	$0.59 (for 2)
C2, C3	1 uF 16 V	272-1434	$0.59 each
D1-D4	Diode, 1N914	276-1122	$0.99 (for 10)
*D5	Diode, 1N914	276-1122	
IC1	Op amp, 741	276-007	$0.79
R1, R2	100K	271-045	$0.29 (for 2)
*R3	1K	271-023	$0.29
*Q1	Trans. 2N2222	276-2009	$0.59

* Not needed for receive-only interface

Parts List -- Transmit Audio Filter

Part	Value	Radio Shack #	
C1	.1 uF	272-135	$0.59 (for 2)
C2	.022uF	272-1066	$0.69 (for 2)
C3	.022uF	272-1066	
R1	10 K var.	271-282	$0.49
R2, R3	15 K	271-036	$0.29 (for 2)
R4	220 K	271-043	$0.29

Miscellaneous:

Enclosure (RS #270-239 recommended, $2.19), PC board (RS #276-170, $2.79), audio jack (RS #274-316, $2.19 for 4), RFI toroids (RS #273-104 $7.95 for 2), DB-9 connector (RS #276-1536, $1.29), audio cable, plug to match radio.

If you buy all Radio Shack parts for the converter, it should cost $15 for the full circuit (plus transmit portion), not including the RFI toroids. Again, the circuit is not really critical--if you have any parts lying around that fit, use them!

CLOSING COMMENTS

This FAQ list was the inspiration of myself and many others on the Fidonet SHORTWAVE echo, who have been using and experimenting with HamComm and JVFAX for over six months, trading ideas and hints along the way. When more people asked me for help, there and on the Internet, I thought of the obvious and wrote this! <g>

The following get credit for lending me a hand:

W.F. Schroeder (DL5YEC), Pawel Jalocha (SP9VRC), Reid Kelly,
John Palaima (N1NIG), William Nolle, Tom Carney (WB9RJX),
Ken McKenzie, Derek Buchler and Stephen Lee.

Additions wanted
---

1) I'd like a list of "cornerstone" RTTY and FAX frequencies.
In other words, if you're on the US West Coast, in Europe,
Africa, the Mideast or Asia, what stations do *you* hear best?
I'm not looking for an entire Klingenfuss text, just a few good
frequencies for various parts of the world.

2) I've learned of another fax program, HFFAX5 (no, it's NOT
related to SSC's software as far as I can tell..) The doc
files that come with it are of the "I got this neat program
from a friend-of-a-friend" slant, and I'd like to find out its
status (shareware, freeware or pirateware) before I write about
it further. Nothing gets my goat like mysterious ZIP files with
no documentation!

2A) And has anyone used FFTMORSE (Soundblaster CW) or TOR117
(AMTOR terminal unit in software)?

3) I'd like to hear from anyone who's tinkering with the interface
or even the Pktmon source.

4) I do intend to update this list with the introduction of new
shareware, updates to existing programs, or (most likely) stuff
everyone else is using but that I never heard of. <g> (A new
version of HamComm is slated for later this year, BTW.)

More questions?

If anyone has questions or comments or even flames, drop me a
line! My address(es):

Use GPS - Global Positioning System. Almost all GPS receivers have
computer interfaces that provide time-of-day (along with lots of other
information). And many receivers provide a second, dedicated "1pps"
(1 pulse-per-second) output that is generally accurate to better than
a microsecond. The GPS constellation is almost complete, and there's
already 24-hour coverage with at least 3 satellites.

GPS receivers have historically been expensive, but prices are
dropping fast. Just last weekend at Dayton I bought a new Rockwell
NavCore V OEM board with antenna for $500. It includes the 1PPS
output.

Hi

I've just recently started to get into PACKET radio but I'm having a
few problems...
Firstly I'm using a Commodore 64 with DIGICOM V5.0 software.
The PACKET MODEM I'm using is one that I have constructed from plans
drawn up by Craig Rader, N4PLK.
I am using a Kenwood TH78a. I've had no problems at all with receiving
PACKETs but when I try to TRANSMIT the PTT is not keying down long
enough. Using my Ohm meter and reading what happens between the GROUND
and PTT line when my Kenwood is NOT connected... the Ohm meter drops to
a low Z, for a reasonable length of time, when I try to send data from
my C64, however when I reconnect my TH78a and try to send data the PTT
only stays active for only a very very brief time.
Any clues???

Thanks for any feedback at all!

73s Carl ZL1UWV.

I have uploaded to WSMR-SIMTEL20.Army.Mil and OAK.Oakland.Edu:

pd1:<msdos.packet>
PTM522WW.ZIP   Danish Packet Terminal & Mailbox - Multi-ling.

PTM Packet Terminal V 5.22 is a Danish Packet Terminal and Mailbox.
At the moment PTM is able to talk Danish, Swedish, Norwegian, English,
Italian, Spanish, French, German and Russian. It supports several
modems: TNC2c, PK-88, PK-232, KAM 2.85, KAM 5.02, and TNC241. The
mailbox will default to english, but give the user an option to change
the language to be used.

The PTM Mailbox does support file uploads and downloads, and many other
features.

The program can be used with no limitations, but the author asks users
to register - Read the following section of the documentation:

- -
        If you do not register your copy at once the only consequence
        is that PTM will flash a reminder for 30 sec's before starting
        up. There are no other limitations in the program.

The Delta Amateur Radio Club of Memphis, TN., will be hosting "W4BS"
Special Event station to commemorate the 50th anniversary of the 25th and
final mission flown by the world famous B-17 "MEMPHIS BELLE". The 25th
Mission was flown on May 17, 1943.

This special event will be from 1300Z, May 16th until 0100Z, May 17th. The
transceivers will be set up in the pavilion next to the "BELLE" on Mud
Island in Memphis, Tennessee. We will operate the following stations:

```
 2 Meters - 146.550 Mhz
10 Meters -  28.455 Mhz
15 Meters -  21.320 Mhz
20 Meters -  14.305 Mhz
Packett   - 145.01 Mhz and on the Internet Converse (CH. 25)
```

For an especially nice certificate send QSL with contact number and SASE
to:

```
MEMPHIS BELLE
c/o DARC
P.O. Box 16343
Memphis, TN  38186-0343
USA
```

For more information, please contact:

```
David Moore at:

Hi,
  Someone sent me a section of the pmp.cfg file to allow pmp to
  use the baycom modems. Well, I still am having diffulties in
  as much as the modem doesn't seem to be getting any power.
  According to the way I see it the modem gets its power from
  pin 2 which is data out from the computer. Can it correctly
  be assumed that there is a loop that sends 0xf or something
  to the xmit holding register continously to keep it powered
  up.

Has anyone had the opportunity to modify an Icom 229H for use with any of
the 9.6 Kb modems? It would appear from the schematic supplied with the rig
that it is possible to tie into the VCO's varactor and access the
discriminator output in the unit. However, has anyone had success in doing
so and is the IF bandwidth wide enough or the t/r switching fast enough?

Thanks in advance for any information that is provided!

Hi again,
  Come to think of it, has anyone seen any source to run the baycom
  version. There is much available for the parallel version, but I
  have yet to see any for the serial version. Even a test program
  would be helpful.

Hello all!

A friend of mine (Internet-less, poor soul) is looking for a Baycom-PMP style
of program called EZPACKET. I have never heard of such a thing. Has anyone
else? If so, is it available by ftp? dialup? snail mail?

Thanks and 73 de Dan N7NKR

Does anyone have NOS running on OS/2? If so, is it a special version or is
it run under a DOS window? Any comments would be appreciated.

Thanks

I just downloaded ezp140.zip (I think that was the name) from oak.oakland.edu
in the pub/msdos/packet directory. This program is for standard serial
control of a TNC and not for the Baycom/PMP packet modems.

There are two versions for OS/2 of which I am aware. One is text-mode,
and is essentially a port of the standard DOS NOS. The other is a PM
program, but seemed to have a lot of rough edges (it's newer). If
memory serves, both are by the same author, and are on ucsd.edu for
ftp.

Hi YLs, XYLs und OMs,

bei mir laeuft inzwischen Linux/Wampes, es besteht also eine Moeglichkeit,
UNIX via Packet zu erreichen.
Ich wuerde mich sehr freuen, wenn sich einige einloggen, und Kommentare
zu meinem System (Konfiguration usw.) sowie Verbesserungsvorschlaege an mich
senden wuerden.

Login via AX25 -> DB0LAN -> DL3RDR-9
(ab Mai wieder im Studium: AX25->DB0MWE->DL3RDR-9)

NB: Falls ich unter DL3RDR aktiv bin, so laeuft lediglich SP (das brauche
    ich vorerst noch, da unter Linux die Mail-Sachen noch nicht richtig
    laufen :-)

Kommentare an dl3rdr (als lokaler Benutzer im Linux) oder an DL3RDR@DB0LAN.

Vielen Dank und viel Spass,
Martin

NNTP-Posting-Host: ifsws1.sozialforschung.uni-stuttgart.de
Summary: invitation to the PacketCluster sysops mailing list
Keywords: PacketCluster,G8BPQ,FTP,Contest

I would like to invite all Sysops of PacketCluster nodes to our email
discussion list which discusses all about the PacketCluster Software.

What you have to do to get in it ?

First of all - you need to have an email adress.

Send a message to listserv@ifsws1.sozialforschung.uni-stuttgart.de
with a message body of "help" - this is to show you the commands
this mailing list server supports.
Then, send a second message with a message body of
"subscribe packetcluster firstname lastname (callsign)".
(Please note that it is _message body_ and not _subject_!)

so if you are Dick Newell and your callsign is AK1A,
the line would be:

subscribe packetcluster Dick Newell (AK1A)

Also there is an anonymous FTP server to supply
PacketCluster-related software, information files and databases.
The FTP server also has a directory for G8BPQ and contesting stuff.

FTP to 141.58.162.1, login as "ftp", choose any password.

Then "cd /pub" - that's where the things are.
Feel free to upload files to /pub/uploads, don't forget to leave a *.txt file
to describe your upload.

73! Frank DL1SBR

Some notes from experiments last night, after I plugged in a breakout box with a light for each line.

Running the baypac program used for calibration, I note the following when testing for audio level; DTR is held high and CTS & RTS pulse high upon init. When open squelch is detected, CTS goes high.

When running the baycom program, best I can determine is that the DTR line goes stays high and the CTS line goes high when receiving audio. Note, the baycom program does display received packets.

Finally, using my own test program, which turns on DTR and then monitors the CTS line, the CTS line seems to go up and down with received audio or open squelch.

So, got any ideas, I did receive two replies, which were non-conclusive. I wonder if the design has changed somewhere between the original and the ones sold by Tigertronics. I also still wonder about that connection too pin 2.

Your proposed scheme is about a million generations old and is the worst
of all possible error corrections WITH THE EXCEPTION that it could be
implemented only by rewriting the software in TNC's. I am at a loss
as to how this could be efficiently done since one of the major difficulties
with bad packets is that you lose framing when you lose a bit (bit stuffing,
etc. can byte you in the butt). FEC produces MUCH stronger error correction
at the cost of having to change hardware.

Bob

Does anyone know if/where 2 line elements sets for satellite tracking
are available via anonymous ftp? I understand that there are different
formats of 2 line elements as I have two different programs on different
computers I'd like to try (Traksat under MSDOS and another satellite
tracker for the Amiga) so I guess I'd need to know if a conversion
program exists or which type of elements are available where.

I'm primarily interested in tracking amateur and amateur-related
satellites (Mir and the shuttles when there up with SAREX) but would
like for curiousity's sake a more complete database which includes other
satellites of interest like NOAA, HST, etc.

Private email responses appreciated.

Does anyone know if a source for the TCM3105 modem chips (as used in the
Baycom and my PMP modems)? Ideally, something that is geared toward
hobbyists: small quantity, mail order, etc.

For years, we've been buying them from a distributor (Marshall) by the
hundreds for PMP kits. But orders have dropped to the point where we can
no longer afford to offer this service. And all of the distributors I've
checked have some crazy minimum order ($100, or so).

I'd like to find a source for those still interested in building PMP kits.
Any suggestions?

FEC of a form. I would even go simpler than that, I would take *any*
differences and try them all (why look just for pairs that match). The only
(slight) problem is that you are increasing the chances of receiving a packet
full of errors as if it was correct (Data wrong, CRC sez not). There are
also cases of bit slipping too (loose a bit) that could get your mind
wandering.

I did something like this with passall-on and let the confuser reconstruct
traffic on the channel from the ascii streams. I did *not* see any improvement
of copy (and I took a performance hit on the box as it was slow already), but
that is probably due to the fact I was monitoring rather than being an active
participant (and the fact I did not have access to the CRC) ...

Now, the `technical' problem. The TNC has NO idea what the CRC is, since
the Synchronous UART strips that off before presenting it to the CPU. It is
possible to tell the UART to not do the CRC stuff, but that is a big change
to the software operation of the TNC (Any Z-80 based TNC). I believe the
KAM's processor has good access to the CRC, but with their support, and
our lack of source code ...

Ok, who is going to add this to their KISS firmware first?

Hello Amiga Packet people.

I'm looking to break into Packet myself....and I was reading through CQ,
and saw an ad for PackeTerm.

Has anybody out there used this program? If so, can they post or send me a
quick review of the product?

I'd also like pointers to other Packet related products for the Amiga.

It really depends how strong the CRC is. You could easily get an erroneous
packet which checks out against the CRC. Furthermore, the kinds of errors
you get may cause the receiver to lose sync with the incoming data and
not receive anything at all until it sees another flag. You can't just
store a fragmented piece of a packet without a lot of special effort.

FEC packet would work more easily with less magic; you just program your
TNC to send every packet twice. Heck, rather than using a long TXD you
could a very short TXD and send the packet twice. The TX Delay time is
simply wasted time to let someone's receiver warm up. Sending the
packet twice would give slow receivers a chance to warm up and give
the quick receivers (i.e. people using DCD State Machines) two chances
at reading a noisy a packet....

Does anyone know if a source for the TCM3105 modem chips (as used in the Baycom and my PMP modems)? Ideally, something that is geared toward hobbyists: small quantity, mail order, etc.

For years, we've been buying them from a distributor (Marshall) by the hundreds for PMP kits. But orders have dropped to the point where we can no longer afford to offer this service. And all of the distributors I've checked have some crazy minimum order ($100, or so).

I'd like to find a source for those still interested in building PMP kits. Any suggestions?

It really depends how strong the CRC is. You could easily get an erroneous
packet which checks out against the CRC. Furthermore, the kinds of errors
you get may cause the receiver to lose sync with the incoming data and
not receive anything at all until it sees another flag. You can't just
store a fragmented piece of a packet without a lot of special effort.

FEC packet would work more easily with less magic; you just program your
TNC to send every packet twice. Heck, rather than using a long TXD you
could a very short TXD and send the packet twice. The TX Delay time is
simply wasted time to let someone's receiver warm up. Sending the
packet twice would give slow receivers a chance to warm up and give
the quick receivers (i.e. people using DCD State Machines) two chances
at reading a noisy a packet....

Hi.

I just noticed the yesterday that the locking nubs on my HT's BNC antenna
connector have worn about 1/3 away. I've had this HT for two years,
but it has gotten the most antenna switching wear in the past 9 months
that I've been most active in packet. It is a Heathkit HW2M (made by
Standard).

Has anybody else noticed this problem? At this rate, the nubs should be
worn through in another year or so.
I am going to look into getting another (more wear resistant?) connector
and/or a second radio to dedicate to packet.

Hi, Deane.
I have had pretty good luck with wb7tpy's gateway in Arizona... maybe not the
fastest way to reach your friends on the East coast.
On Internet:
  send to "gate@wb7tpy.ampr.org"
  with "Packet: *full packet address*" on the first line
From Packet:
  send to gate@wb7tpy.az.usa.na
  with "Internet: *single internet address*" on the first line

the first line must be left-justified. an example might be:

% mail -s "hello, brad" gate@wb7tpy.ampr.org
Packet: kb8cne@n9lnq.il.usa.na

Hello, Brad....

^D
%

wb7tpy's name is Dean, I think. He's got a nice setup.
I find the turn-around to be several days to a week and sometimes more.

Lines: 11

G8BPQ does not support a port number when recieving a connect on a level 4
so FBB does not know where the connect is coming from. Because of this, FBB
devaults to port 1.. The problem is with BPQ..

Just like model 100 with built-in basic, note, sched, word, and Telcom
(communication via RS232 or built-in modem). It's in mint working condition.
If you are a HAM, it's perfect for packet on the go.

Price is $100 + shipping/COD.
I can be reached via Email or packet mail KQ4OY@n4awx.#cocoa.fl.usa.na
Please leave a msg (or a number I can reply sooner).

TNX
Tom

Frequently Asked Questions for Amateur Packet Radio

Version 1.13 - Last modified 2/21/93

This document is for unlimited distribution.

Please send corrections and additions to:
   packet-faq@wattres.sj.ca.us
Which will expand to a list of people who are familiar with most packet issues. I hope. ;-)

The Packet Radio FAQ's will be posted on a monthly basis to rec.radio.amateur.packet. The current version of this document is available via anonymous FTP at ftp.cs.buffalo.edu.

Many FAQ's, including this one, are available on the archive site rtfm.mit.edu in the directory pub/usenet/news.answers. The name under which a FAQ is archived appears in the Archive-Name: line at the top of the article. This FAQ is archived as radio/packet-faq.

There is also a mail server on rtfm.mit.edu, which can be addressed as mail-server@rtfm.mit.edu. For details on how to operate this server, send a message to that address with the word "help" in the BODY of the message.

   3.4 BBS message transfer

1 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small bursts, or packets.

1.2 What is amateur radio?

Amateur Radio (sometimes called Ham Radio) is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions posting in rec.radio.amateur.misc. A copy of that FAQ is also available from ftp.cs.buffalo.edu.

1.3 What can I do on packet radio?

Keyboard-to-Keyboard contacts:

Like other digital communications modes, packet radio can be used to talk to other amateurs. For those who cannot use HF frequencies, two amateurs can talk to each other from long distances using the packet radio network.

Packet BBS operations:

Many cities have one or more packet Bulletin Board System (BBS) available on the local packet network. Amateurs can check into the BBSes and read messages from other packet users on almost any topic. BBSes are networked together over the packet network to allow messages to reach a broader audience than just your local BBS users. Private messages may also be sent to other packet operators, either locally or who use other BBSes. BBSes have the latest ARRL, AMSAT, and propagation bulletins. Many BBSes have a file section containing various text files full of information on amateur radio in general.

DX Packet Cluster:

A recent development is use of packet radio for DX spotting. HF

operators connect to the local DX Packet Cluster for the latest reports on DX. Often a user will 'spot' some hot DX and distribute the DX report real time.

File Transfer:

With special software, amateurs can pass any binary files to other amateurs. Currently, this is done with TCP/IP communications, YAPP, and other specialized protocols.

Satellite Communications:

Many of the amateur radio satellites contain microcomputer systems that can provide special information to amateurs. Some satellites contain CCD cameras on board and you can download images of the earth and the stars. Others provide store and forward packet mailboxes to allow rapid message transfers over long distances. Some satellites use AX.25, some use special packet protocols developed for satellite communications. A few transmit AX.25 packets over FM transmitters, but most use SSB transmissions.

1.4 Why packet over other digital modes?

Packet has three great advantages over other digital modes: transparency, error correction, and automatic control.

The operation of a packet station is transparent to the end user; connect to the other station, type in your message, and it is sent automatically. The Terminal Node Controller (TNC) automatically divides the message into packets, keys the transmitter and sends the packets. While receiving packets, the TNC automatically decodes, checks for errors, and displays the received messages. In addition, any packet TNC can be used as a packet relay station, sometimes called a digipeater. This allows for greater range by stringing several packet stations together.

Packet radio provides error free communications because of built in error detection schemes. If a packet is received, it is checked for errors and will be displayed only if it is correct.

With VHF/UHF packet, many countries allow packet operators to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBSes (sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to use the same frequency channel simultaneously.

1.5 What elements make up a packet station?

TNC (Terminal Node Controller): A TNC contains a modem, a CPU, and the associated circuitry required to convert between RS-232 and the packet radio protocol in use. It assembles a packet from some of the data on the serial line, computing an error check (CRC) for the packet, modulates it into audio frequencies, and puts out appropriate signals to transmit that packet over the connected radio. It also reverses the process, translating the audio that the connected radio receives into a byte stream on the RS-232 port.

Most TNC's currently use 1200 BPS (bits per second) for local VHF and UHF packet, and 300 BPS for longer distance, lower bandwidth HF communication. Higher speeds are available for use in the VHF, UHF, and especially microwave region, but they often require unusual hardware and drivers.

Computer or Terminal: This is the user interface. A computer running a terminal emulator program, a packet-specific program, or just a dumb terminal can be used. For computers, almost any phone modem communications program can be adapted for packet use, but there are also customized packet radio programs available.

A radio: For 1200 BPS UHF/VHF packet, commonly available narrow band FM voice radios are used. For HF packet, 300 BPS data is used over single side band modulation. For high speed packet (anything greater than 1200 BPS), special radios or modified FM radios must be used.

1.6 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSMA (Carrier Sense Multiple Access). If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the TNC keys up the radio, and sends its packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet.

In actuality, a more complex scheme is used to determine when the TNC transmits. See the "AX.25 Protocol Specification" for more information.

1.7 What is AX.25?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and

based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified to suit amateur radio's needs. AX.25 includes a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the sender's and recipient's amateur radio callsign, thus providing station identification with every transmission.

1.8 Definitions: Commonly used terms in Amateur Packet Radio

44 net - The class A network designator for TCP/IP amateur packet radio. All numerical TCP/IP addresses are in the format 44.xxx.xxx.xxx.

AFSK - Audio Frequency Shift Keying. A method of representing digital information by using different audio frequencies modulated on a carrier.

AMPR - Amateur Packet Radio.

ampr.org - The high level domain recognized on Internet for amateur packet radio TCP/IP.

AX.25 - Amateur X.25 protocol. The basis of most packet systems. See section 1.7 for more information.

CRC - Cyclic Redundancy Check. The error detection scheme included in each packet. Verify that the packet was received error free.

CSMA - Carrier Sense Multiple Access. A system allowing many stations to use the same radio frequency simultaneously for packet communications.

digi - Short name for a digipeater

digipeater - A packet radio station used for repeating packets. See section 3.3.1 for more information.

FCC - Federal Communications Commission. Regulates and issues licenses for amateur radio in the United States.

FM - Frequency Modulation. The radio modulation scheme used for VHF and UHF packet communications.

FSK - Frequency Shift Keying. A method of representing digital information by shifting the radio carrier frequency different amounts to represent ones and zeros.

HDLC - (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

KA9Q NOS - (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

KA-Node - A simple networking scheme developed by TNC maker Kantronics. See section 3.3.2 for more info.

KISS - Keep It Simple Stupid. A simple interface developed for communications between TNCs and computers. This allows for most of the packet processing to be handled by the computer. Commonly used with packet TCP/IP software.

LAN - Local Area Network. A packet network developed for communications throughout a city or region. Often, the LAN uses separate frequencies from inter-city packet links.

modem - MODulator/DEModulator. Converts the analog signals into a binary data stream (a series of ones and zeros) for the TNC or a micro-computer. First step in decoding packets. It also converts binary data to analog, which is the last step in encoding packets.

NET/ROM - A scheme for packet radio networking. See section 3.3.3 for more information.

NODE - A network node. Often a network node running NET/ROM.

PPP - Point to Point Protocol. PPP is another protocol used for moving IP frames over a serial line. It supports host authentication, and non-transparent serial lines. It also has a standard way of negotiating header (and potentially data) compression over the line. See also SLIP.

protocol - A standard used for intercommunications between different computer systems.

RS-232 (RS-323C) - A (more or less) standard for interconnection of serial peripherals to small computer systems. In packet radio, RS-232 is the most common interface between TNC's and the Computer/Terminal.

SLIP - Serial Line Internet Protocol. A trivial protocol for putting IP frames over a serial line to do (potentially) cheap TCP/IP networking. Approximately the same as KISS, except over wireline networks. See also PPP.

SSB - Single Side Band. The radio modulation scheme used for HF packet and satellite packet communications.

TAPR - Tucson Amateur Packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many others. TAPR continues development of packet radio equipment.

TCP/IP - Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more

information.

TNC - Terminal Node Controller. See section 1.5 for more information.

1.9 Do's and Don'ts : Rules and Regulations

NOTE: These regulations apply only to amateurs regulated by the FCC (United States), but often are similar to regulations in other countries.

[Since I have no experience with amateur radio in other countries, I cannot make any comments. Please bring any notable exceptions to my attention. -ed]

Although there are no specific rules that apply to amateur packet radio, the general amateur radio rules force some restrictions on packet usage.

> Can I set up a TNC at home and one at work so I can check my Electronic mail via packet?

This cannot be done without special restrictions. Amateur radio rules prohibit any business. Since you could have mail from your boss (or maybe even someone selling you something over Internet), that would constitute business activity and is specifically prohibited.

Profanity can also be a complication. Since you have no control over the language used in E-mail, proper filtering is required. Since no filter scheme can catch every offense, it is best to say every message must be hand filtered.

> I would like to set up a packet radio gateway between a land line computer network and the packet network. Is this possible?

Yes, and there are several such gateways in use, but they must be managed with caution. Electronic mail may be passed FROM the packet network INTO the land line network without intervention. However, mail passed TO packet radio is considered third party traffic (the sender is not an amateur) and these messages must be hand filtered to ensure that rules of message content are followed.

> It's my license if I use packet radio illegally anyway, so what does anyone else care!?

Packet radio is one of the few NETWORKED systems in amateur radio. Many people have helped develop the network and there are many amateurs who own parts of the packet radio network. Sending packet

BBS mail, digipeating, and sharing the channel involves the licenses of MANY people. Because of FCC rules stating that anything to come out of a transmitter (either in automatic mode or via your direct control) is the licensee's responsibility, one illegal message sent over the packet radio network could literally jeopardize the licenses of thousands of other amateurs. When in doubt, it is best to check with other amateurs about sending the message before it is sent.

> I have some ideas on how to use packet radio in a new way, but I don't know if it is legal. Who could tell me if I can do it legally?

The worst thing you can do is talk to the FCC about such an issue. The FCC rules are written to be general enough to encompass but not restrict new radio activities. In the past,-faq.. This and 3om at. is o

Newsgroups: rec.radio.amateur.packet
Subject: 9600 b/s full-duplex repeater question
Date: 22 Apr 93 15:04:56 GMT
Organization: UCSD Usenet Gateway
Lines: 14
Message-ID: <01GXB3A5TAJ6ISQONJ@tntech.edu>
NNTP-Posting-Host: ucsd.edu
Originator: daemon@ucsd.edu

I am looking into building a 9600 b/s full-duplex repeater for use on
our LAN and have a few questions. The idea is to use the TAPR 9600 b/s
modem board, a TX and RX, but without a TNC or other equipment. (The
TAPR board has a bit regenerator option.)

Has anybody done this already?

What about repeater control and ID? (Is this even legal as described?)

What about connecting a P10 or DataEngine to it at a later date to provide
inter-LAN connectivity?

Thanks in advance,
Jeff Austen, k9ja, Cookeville TN, Internet: jra1854@tntech.edu

Hi Ian,
I'm running win 3.1 on a 1MEG 286 using Baycom 1.5a. I have no probs at all other than my system is kind of slow due to being 286/1MB. I have had it running on a 4MB 486 with no prob either. I did not use any PIF files. Only ran it directly
using Icon which points directly at the executable (ie from file manager drag the Baycom.bat file to desktop folder).

Other info which may help: baycom modem is on com1, mouse is on com2, phone modem is on com3.

Good luck,
Tom - KQ4OY @n4awx.#cocoa.fl.usa.na

PS I have had both the Baycom and phone modem running and connected to different PBBS and BBS on the 486 system.

Hi folks!

I'm new to packet radio and I'd like to know what I need to
build a TNC (poor mans packet?) and what software is available.

If there is stuff for UNIX too that would be great!

     Lots of people are asking how to get on to Internet from Packet.
I am also interested in this Info. So I assume that there many more people
who want to know. Could some one post a list of the gateways on this group.
Thanks.

But since the radio 'port' can change during the course of a NET/ROM session
it would be of little value for BPQ to supply a port number.

                          How to Use the WB7TPY
                        Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
    a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.

    No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
    packet radio: WB7TPY@WB7TPY.AZ.USA.NA   -or-
    Internet   : david@stat.com   -or-
    Fidonet   : David Dodell @ 1:114/15

(5) Have fun. Use the gateway as much as you like. That is what it is
    there for.

                          From Internet to Packet

Send mail to the internet address of:

gate@wb7tpy.ampr.org

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

                          From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@stat.com

      Internet: david@stat.com   FAX: +1 (602) 451-1165
      Bitnet: ATW1H@ASUACAD   FidoNet=> 1:114/15
                Amateur Packet ax25: wb7tpy@wb7tpy.az.usa.na

I expect to acquire an mfj1278 converter shortly.
Is there any information that could be shared on
mods, problems, configurations, etc? Is there
any PC software (other than mfj's) available?

Please send info via email, or direct me to ftp site.

Thanks very much

Before getting too excited about the cable company's maintenence, etc.,
be sure the interference problem isn't caused by RF getting into the TV
receiver on the cable shield. Wrapping a few turns of the cable around
the TVI is ralated to harmonic operation. If the cable channel is not a
harmonic (or the fundamental) of the transmitting frequency, the TVI is
probably not caused by leakage.

This weekend, while visiting my in-laws in Madison, Wisconsin, I noticed
that one of the cable channels was being interfered with from time to time.
Just for the heck of it, I grabbed my 2m HT and repeater directory, set my
HT to each Madison repeater's output, and waited. Bingo! Each time a
certain repeater transmitted, the cable got messed up. Needless to say,
I haven't shared my discovery with the in-laws yet. :-)

Thanks to Chris Spell <spell@seq.uncwil.edu>, there is now a mailing
list for AA4RE BBS program sysops. I hope all will subscribe. It
should be very helpful to all of us.

Roy, AA4RE

 - - - -

   To send a message to the mailing list send it to:

       aa4re@matsci2.uncwil.edu

 - - - -

   To subscribe to the mailing list a user needs to send a message to:

       aa4re-request@matsci2.uncwil.edu

   With the following in the body of the message:

       subscribe aa4re your_account_name@your.address.whereever

 - - - -

   To unsubscribe one would send this text in the message:

       unsubscribe aa4re your_account_name@your.address.whereever

Chebyshev filter??? This will really mess up the data! You want to
maintain the integrity of the data, but the poor group delay response
of this filter will create alot of intersymbol interference. Surely
a Bessel, FIR or other linear phase filter is what should be used.
(or have I miss-understood the use of this device??)

Heres my reply

We selected the the Chebyshev filter because it has the best rejection
in the stopband. Because the modem was designed for the crouded H.F.
packet frequencies, we needed the best filter that provided out of band
rejection. It's true that the filter has poor group delay but we found
(using computer simulation) that different filter types performed about
the same. Another filter may have better group but you sacrafice the
stopband rejection.

Chebyshev filter are some what linear within the bandpass, however, the
group delay is non-linear at the band edges. We simply normalized it to
obtain the best of two worlds.

Not mentioned in the article was (it appeared in the Oct 92 issue of QEX)
a new filter called the "Bowtie" which is used in the channel filters
(Discriminator circuit). The Bowtie uses two two pole bandpass filters
(usually state variable types) In the mark and space channel to provide
maximum seperation and linear phase.   An article will appear in future
issue of QEX.

Until last year, the protocols of the annual computer nework conference
 outld be obtained from the ARRL. However, the last few issues of the ARRL-ad
in the qst-magazine (I could not scan them through systematically), did not
mention any of the protocols. (This applies als to earlier protocols.)
So I have the following questions: Did the computer network conference
fade away? If not, where can I get the protocols?

Thanks in advance

Looking for opinions about the digital (RTTY, AMTOR, etc)
software that performs the function of the TNC, only requiring a
simple modem - such as the commercially available G4BMK package or the
freeware HamComm. Intuitively, this makes a lot of sense, to me at least.

Just wonder how this works in practice.

Am attempting to crosspost to "packet" because I figure there will be
a lot of relevant expertise there but don't receive that group so would

You are right Gary, there is some volume there! I saw the discussions of
Loran C out of my pocket book range so I ignored them ...

>aside from packet which *still*
>has more posts in misc than packet as witness the latest PK232 vs KAM
>postings.

I am sure some of that problem is due to the fact that we may also be a victim of the ListServer mentality (or should I call it A-news mentality). Sure, anyone on the end of a listserver, or has been used to the List will create some resistance to compartmentalizing the discussion. It is hoped that posting (or xposting <jab> <jab>) a set of short FAQs every two weeks, with some dedicated individuals providing email nudges will keep this to a minimum.

Besides, PK232 vs KAM discussions *belong* in the *.misc Quagmuire :-) along with my dad is bigger than your dad ;-)

I am disturbed that we have had *little* input from the Listserver users. To that end, if a listserver user doesn't know where to turn to, in order to post their opinions to news.groups, I have set up news.groups@ve6mgs.ampr.ab.ca to cross post to: news.groups,rec.radio.amateur.misc,rec.radio.amateur.packet for the RFD and CFV period.

Here in Winnipeg, MB (Canada), we are having a similar problem.
The entire southern end of the city seems to be affected by some
interference from some sort of transmitter. It has been there for years
and is getting worse as well as spreading to more chanels. It used to be
limited to CH 17 to CH 19 but now has spread to CH 24 in somewhat rare
cases.

In some areas, the signal almost totaly vanishes (south side of the
central core area). The cable company doesn't care about such things and
has shown no interest in getting rid of the problem.

They have enough garbage chanels. I wish that they would just rearrange
the chanels AGAIN and put the garbage ones (airline schedule?!?) on those
chanels.

Do you know what frequencies chanels 17 to 19 use and what is usually
allocated to those frequencies for broadcast outside of cable?

I did a study on CAtv INGRESS about 11 years ago and found that cable
sheath quality, and ground termination aging or corrosion were 2 major
sources of INGRESS. AMong others were people with improperly loaded
terminations, such as splitter connections to their FM radio at 300ohms
etc or just open cct. THe MID-BAND channels are always notorious for
broadcast interference, even sources like induction motors used on diesel
trains cause huge levels of interference, (if you happen to back on a
railway).

THe quality of the cable is crucuial with various type and blends of
shields, 100% braid coverage is not necessarily best. Dual shieleded coax
with braid & foil are generally best with solid copper used on trunks.
The cables were replaced a few years ago in WInnipeg to improve on the
midband noise shielding and also widen the system bandwidth.

I don't beleive TV's are the cause of noise INGRESS, it's mainly the
cable shield and shield grounds. Of course buried cable is best since the
ground path lengths are short, but if your city uses aerial cables, then
the ground path lengths can become significant sources of ingress along
the distribution lines in the neighboorhood.

In article <gtaylor.139.0@taex003n.tamu.edu> gtaylor@taex003n.tamu.edu (Gregory S.
Taylor) writes:
>Looking for opinions about the digital (RTTY, AMTOR, etc)
>software that performs the function of the TNC, only requiring a
>simple modem - such as the commercially available G4BMK package or the
>freeware HamComm. Intuitively, this makes a lot of sense, to me at least.
>

I have built the receive side of the simple circuit that goes with the
HAMCOMM program. I can receive HF RTTY with this but there is a fair
amount of noise. I have been told that this may be due to insufficient
audio filtering. I am going to build an 8 pole bandpass filter to try
to improve this and see how it works.

The HAMCOMM program is interesting since it has both a tuning mode and an
audio spectral display mode. It cost me about $4 to make the receive
side of the circuit (with some parts from the "junk-box").

I am also interested in implementing AMTOR (which HamComm does not do)
in software but that looks like a long term project.

You may also find the article "A Multi-Mode Computer/Radio Interface" by
James C. Vandiver (WB4LHG) interesting. It is in Nov. 1992 QEX.

As is typical nowadaze, you will probably have to do somebody else's job
for them. Although this shouldn't be needed, you might take a few minutes
to wander around the neighborhood with an HT sniffing for cable leakage
on your freq. after shutting down your system for a while.

If you are fortunate enough to the find the hole, call the cable company and
get the highest link in the chain of command you can. Explain the problem,
whose job it really is to maintain THEIR equipment, and how much of a nice
guy you are to have tracked down THEIR problem for them.

You may have been lucky and made a new contact that could be helpful in the
future.

You should always try the 'honey' approach before bringing out the
Jack Nicholson impressions..... >:-)

This has worked for me in the past with the power company when tring to
find loose/noisy high voltage lines/hardware. Only once did I have to
tell them I was narrowing the problem down to a specific pole by bumping
a whole line of poles with my car. Got 'em out there THAT NIGHT. And, they
didn't have to meet Jack!

As a disclaimer, THEIR method for finding loose hardware was usually
whacking the poles with a huge sledgehammer after their high tech arc-

finding 'scope couldn't find the problem.

I am trying to help out a friend who is running Baycom and now NOS.
Baycom works fine but when it comes time to run NOS, the packets
are not being decoded all the time. Would anyone interested in
helping me out please drop me a line. We can discuss parameters
and such. I know it is not the radio or hardware as we thought
of that first and now discover that baycom can read the packets
were NOS cannot. We are running WG7J 1.08b NOS.

Thanks and 73

Randy

I also have a problem with Channel 19 (CNN) - I can often hear people's
pagers and there are lines through the picture which come and go
with the transmissions. I wrote to the local FCC office and they turned the
problem over to the cable company who did nothing. I gave up after a year of
letters and phone calls. I got the impression the FCC was powerless and it

was up to the cable company to correct the situation.

I live about two blocks from a microwave repeating tower but I'm
not sure if the tower is the problem. The problem is very irritating - why
can't the cable company, who knew there was a problem with this
channel before I wrote my letter, make that channel a blank?

All you might ever want to know about the KA6ETB HAM-server

Hardware:
========

386/25 PC clone
Telebit QBlazer modem
10-Meg file space reserverd for archive

Software:
========

Waffle 1.65
WFSmail 2.03

General Information:
==================

Orders for files are filled between the hours of 0100-0500 daily, Pacific
time. This is so those hosts through which the traffic is forwarded are not
overloaded. Since we all depend on the generosity of others to carry the
mail, it behooves us not to make them angry.

There is a daily limit of ALL requests of 3-megs. If there are a series of
files you want to order, stretch them out over a few days, rather than
ordering all at once. That way, you are almost assured of getting them
all, and you won't be blocking others from getting their orders filled.

ASCII (text) files are split at about 59,000 bytes. UUENCODED binary files
are split at about 750 lines.

/hamradio/newfiles/ contains files that have not yet been categorized.

A new INDEX is automatically generated every Sunday.

New files are being added and old files are being changed and updated.
You might want to send a order for NEWFILES <date> from time to time,
to see what's new. <date> has the form of MM-DD-YY and is required.

Ordering Information:
====================

Send an email to:

     HAM-server@GRAFex.Cupertino.CA.US

In the text of the message, place:

     HELP
     INDEX
     GET /hamradio/00-INDEX.TXT

HELP will send you the HAM-server HELP file. This is processed immediately
for return delivery.

INDEX will send you an index of the files and the directory they are in.
00-INDEX.TXT is a description of most of the files in INDEX. This file
is in a continual state of flux, therefore many of the file names listed
therein may not match INDEX, but you can figure it out.

A new index is automatically generated every Sunday night.

If you are using a PC and you do not have UUDECODE, follow these steps:

1.   Order UUDECODE.BAS or UUDECODE.C, and UUEXE515.ZIP.
2.   Compile UUDECODE.BAS or UUDECODE.C on your system.
3.   Use the resulting executable to UUDECODE UUEXE515.ZIP. UUEXE515 has
     documentation about UUENCODE/UUDECODE.

You are all set to start ordering binary files from HAM-server.

Some Reasons Why Ordered Files Are Not Received:
===

1.   Your return path is incorrect. My bounce mailbox fills up quite
     regularly with messages. And, since the path is incorrect, I cannot
     contact you to let you know.

2.   You have spelled the file name incorrectly. Use the file names
     listed in the INDEX, rather than 00-INDEX.TXT. The latter is only
     a guide.

3.   The file name has changed since the INDEX was generated. Order a
     new INDEX.

4.   Your order was sent to KA6ETB@GRAFex.Cupertino.CA.US, instead of
     HAM-server@GRAFex.Cupertino.CA.US. File requests sent to me
     will not be honored (naturally).

5.   The 3-meg daily limit has been reached. Try again.

Hi all,
 In my ignorance I assumed they were the same. Now I have a Baycom
 modem, (which works fine) and some software for the PMP version. I
 really need to use the PMP version or any thing that will give me
 source control of the program. I had already done extensive software
 mods to the PMP program and thought I was ready to go.

 Does anyone know where I can get source for the baycomm style of modem
 or failing that where I can buy ready made modems that use the PMP
 software.

 Thanks for any help you can offer.

 P.S. The Baycom modems plug into a serial port and the PMP modems
 into a parallel port.

My port of V7.20 of the IBM CBBS to the Amiga is available for anonymous

ftp on ftp.usask.ca in pub/amiga/hamradio/cbbs-720e.lzh
The source code is in a separate file in the same directory.
There is also an archive of the 7plus program for the amiga which can be used
in conjunction with CBBS or separately.

The modern way to do this is with DSP. There's simply no better way to
build a sharp, phase linear filter than with a finite impulse response
(FIR) DSP routine.

>Other critical areas are the slicer, which has to deal with off
>frequency signals, and the scrambler that removes any DC component
>to the modulation. A DC component can corrupt data slicing at the
>receiver by effectively shifting the transmit center frequency.

The slicer should also go in favor of a fast A/D converter that
doesn't discard information. The slicer discards "bit quality"
information that is extremely useful when you start using forward
error correction coding. This is called "soft decision" decoding, and
it provides about a 2dB advantage over hard decision decoding (i.e.
slicing immediately to binary). You don't need many levels out of your
A/D converter, 3 bits (8 levels) gives you most of the gain.

The WA4DSY transmitter is pretty good, but the receiver really ought
to be replaced with a DSP engine. Modern DSPs are probably fast enough
to do a pretty good job of coherent demodulation at 56kb/s (the DSY
demod only does noncoherent), and today's 386/486 chips are fast
enough to do some pretty strong FEC in real time at 56kb/s. Let's
see... 3 dB gain for going coherent, 5-6 dB FEC coding gain (much more
against non-white noise like radar), another dB or two for a better
matched filter...pretty soon you're talking about some serious
performance gains!

Phil

Hello to the network

I heard from a local bbs sysop that MSYS 1.14 was available on some
ham oriented LL bbs'. Does anyone know if it can be ftp'd from any
site? Any info would be appreciated. Thanks in advance.

Regards
Glenn Butzlaff

This sounds good, but I bet the DSP would cost as much or more than all
the components on the DSY modem now.

10 dB improvement should be easy to do, but the cost would start
to put the modem into the TS850 price range, without RF. In most
cases (except southern Calif. of course:-) that 10 dB is not really
needed with existing transverters. At 440 and 220, if you have
line of sight 10 watts should be more than adequate to give decent
performance with the existing modem. If you don't have line of
sight other problems (like ISI from multipath) are going to give
you a real hard time. If the DSP can make use of the multipath
signals to enhance it's performance, it would be useful!

Of course as we move up to the microwave bands the whole story
starts to change. But for those bands we would need a modem with a
144 MHz IF (to take advantage of the DEM transvertors).

The adjacent channel performance of the stock DSY modem isn't that
great (at least on my modem it isn't), perhaps good digital filtering
could help out there some (tho I suspect that most of the degradation
would be due to strong adacent channels getting into the lo IF). But
then I don't know of anybody else that is seriously considering putting
up 2 DSY repeaters on adjacent channels from the same site for LAN
traffic.

About coherent demod. The reason (at least the reason explained in
the GRAPES video) that non-coherent was chosen, was in part, because

if offered much faster lock up times. What kind of lock up times
can you reasonably get with the sort of demod you're looking at?
I know commercial burst demods can lock up in less than 64 symbols,
but then for $15K one would expect fast lock up time.

well....we're kinda powerless to do anything about it - ifn y'all gonna break
things into smithereens, and the server gang doesn't make it a list, we're
never going to see it (unless we get the Real News Feed someday).

certainly i understand the power of a threaded reader (such as tapcis/tappet
combination for running CIS forums), but from the mail side, things don't seem
to be so oppressive or overwhelming that i can't at least browse the headings
for interesting things and use the search feature of my file browser to locate
anything of immediate interest....

and i can put it aside (famous last words...), i guess. is the problem really
from those that have only a narrow interest in this all-encompassing field of
amateur radio yet feel their subject is deserving of the fame of a
rec.radio.amateur.<subject> heading?

of course, i haven't figured out those cost charts Paul posts yet either...so

maybe i'm all wet...but the current system seems to be working for me so i'm not sure a change would be "good".

How could they have done otherwise?? Cable frequencies start at 2 Mhz and go up to almost 1 Ghz according to the published industry standards. Most Cable TV starts at 54 Mhz and has at least 38 channels. Let's see, 38 * 6 = 228!! That makes it from 54 Mhz to 282 Mhz. That covers 2 ham bands (and pretty clos to a third) and dozens of other sevices. Short of fixing their leaks, there is no way to avoid interference. At least until they get the fiber in. ;-)

NNTP-Posting-Host: ucsd.edu
Originator: daemon@ucsd.edu

I've been trying to solve this problem for a couple of weeks now, and it is still
stumping me. I'm running the F6FBB code, on top of the G8BPQ node switch. All
the ports
(3 radio, 1 one modem) work correctly. Configuration is:
Port 1: PK-232 in KISS mode - attached to physical COM 1 at the PC
Port 2: DRSI Type II board, using the first connector on the card (DRSI 'Port 0')
Port 3: DRSI Type II board, using the 2nd connector (DRSI 'Port 1) (same card as
above)
Port 4: Hayes modem

The problem I'm having shows up on incoming packet connects. The system always
reports
that the incoming packet connect is on Port 1, even though it may have come in on
Port 2 or 3. As I said, the ports all function correctly, so I'm assuming I've
got
a problem in the order of how the ports are accessed. I've got the ports defined
in the G8BPQ BPQCFG.TXT file in the same order, with the same PORTNUM, as in the
FBB PORT.SYS file. The node switch is keeping track of the ports correctly, of
course.
It's just that the FBB can't seem to correctly determine which port the connect is
coming in on.
Any Ideas / solutions would be appreciated.

For all those wondering, according to a chart I have here are some
Statistics for you about cable TV channels and the such:

Channel	Bandwith(MHz)	PIX	COLOR	SOUND
17	138-144	139.25	142.83	143.75
18	144-150	145.25	148.83	149.75
19	150-156	151.25	154.83	155.75

And so on each is increased by 6 MHz

I read somewhere on the list about channel 24 well:

23	216-222	217.25	220.83	221.75
24	222-228	223.25	226.83	227.75
25	228-234	229.25	232.83	233.75

Looks like the 220 ham band could have the potential to get in with
these channels also. The 440 ham band would interfere with channels
59, 60, and 61, if anyone is interested.

HI,
  Some time ago someone posted out some code that would allow either
  NOS or NET to access a DRSI modem card. Would some kind soul tell me
  where that file is archived and under what name. I can't seem to
  find it.

  Thanks,

> In my ignorance I assumed they were the same. Now I have a Baycom
> modem, (which works fine) and some software for the PMP version. I
> really need to use the PMP version or any thing that will give me
> source control of the program. I had already done extensive software
> mods to the PMP program and thought I was ready to go.

I use a Baycom modem with PMP software and it works great. The
trick?....

First, you have to redefine the txport, rxport, cdport, and pttport
parameters in the PMP.CFG file. Also the init lines.....

```
pttport 0x3fc 0x02 0
txport  0x3fc 0x01
rxport  0x3fe 0x10
cdport  0x3fe 0x20 0

init 0x3fc 0x01
init 0x3fb 0x40
```

BTW, I made no mods to the actual PMP program at all, just

the PMP.CFG file.

Second, you have to have a carrier detect signal coming from your
Baycom modem. This is pin 3 of the TCM3105 chip. It should go
through the extra inverter in the 74x04 chip (I think that was the
chip number) and then through a resistor to pin 6 of the DB25 RS232
connector. The resistor should be the same value as the one used on
the incoming data line. (I know I'm being vague, but I'm at work and
my info is at home and I'm doing this from memory).

> Does anyone know where I can get source for the baycomm style of modem
> or failing that where I can buy ready made modems that use the PMP
> software.

I'm pretty sure you can find the source on ucsd.edu. I had to use
PMP because my old Toshiba 1000 laptop has DOS 2.1 built in and it
is incompatible with the Baycom software. PMP seems to work fine.
PMP is also, IMHO, much easier to use than the Baycom software. I
have used the Baycom software on my 286 in the shack.

> P.S. The Baycom modems plug into a serial port and the PMP modems
> into a parallel port.

That is why you change the PMP.CFG file as above.

Good Luck, you should be able to make the Baycom modem work with the
PMP software and I know you'll be happy with it. I am!

Message-ID: <1qh8gtINN6jt@zephyr.ens.tek.com>
Reply-To: Ron.C.Kirkpatrick@tek.com
NNTP-Posting-Host: cascade.ens.tek.com

I received my KAM Enhancement board (KAME v6.1) and HostMaster II+ (v3.11) Friday and installed them (also Friday).

I have set up my KAME to automatically forward to my local BBS (running AA4RE). While my KAME does forward both Personal messages and Bulletins (I find them on the BBS), it does not flag the messages/bulletins on my KAME as being forwarded (F) or even kill the message. Consequently, it will try again an hour later.

Has anyone else experienced this problem or is it just me? Kantronics hasn't heard about the problem from anyone else when I called Monday. (It took 3-1/2 hours to get through.)

FYI, DISPlay Pbbs shows:

```
  PBBS     105
  PBFORWRD OR9000  VHF  AFTER 1
  PBHEADER ON
  PBHOLD   OFF
  PBKILLFW OFF
  PBLO     NEW VARIABLE
  PBPERSON OFF
  PTEXT    Welcome to OR0151-1/PBBS. Please leave a message.
```

Translation:

> My PBBS will store 105,000 bytes of messages. The PBBS forwards to the node OR9000 via the VHF port when someone disconnects from the PBBS and will attempt once an hour until delivery is made. Received headers are stored in the messages when they are forwarded from the BBS. Messages received for forwarding will not be held for SYSOP review, but will be automatically forwarded. Messages forwarded will not be killed, but will be marked with the forwarded flag (F) to prevent them from forwarding again. The PBBS will list messages from newest to oldest, but the user has the option of changing the order in which messages are listed by using the LO command. The personal mailbox will allow messages to be sent to any callsign. And last but not least the customized text that users of my PBBS receive when they connect in.

Other DISPlay information is available upon request. And yes, I am using the KAME in Civil Air Patrol.

Subject: KA9Q more than 2 packet drivers ?
Date: 14 Apr 1993 15:34:27 GMT
Organization: Technical University of Berlin, Germany
Lines: 13
Message-ID: <1qhau3$eni@news.cs.tu-berlin.de>
NNTP-Posting-Host: kubismus.cs.tu-berlin.de
Mime-Version: 1.0
Content-Type: text/plain; charset=iso-8859-1
Content-Transfer-Encoding: 8bit

We try to route two protocols (ethernet, isdn) through KA9Q - both are
implemented under DOS as packet drivers at two different soft-interrupts
(0x60 and 0x70) but they don't work together. Does KA9Q only support
one external packet driver or a certain interrupt-area?

W can get both, the WD8003E driver and the PAPI driver running separately,
but they don't work at the same time. Any hint is appreciated.

Please answer via e-mail, because I'm usually not reading this group.
Thanks for evry hint in advance!

What you need is the next beta release of AA4RE BBS (2.1G) that should
be out in a week or two .. :-) .. The BPQ switch does NOT identify
the incoming port since it is possible it could change during the
conversation. However, there are ways around this and I have the code
somewhat functional right now.

I've toyed with the idea of building a small transverter to
convert the 28MHz IF to 144, to allow the 1296 & higher Down
East transverters to be used. I was figuring on something as
simple as a crystal locked PLL LO feeding a couple of DBM.
Add a 28MHz filter on rx and a toko helical on tx - maybe
a single stage of amplification in each direction..

I'm thinking that the NF isn't important this far down the
chain, but I should pay attention to the LO quality.

Am I missing something ? It's nice to think in terms of little
building blocks, but I'm always afraid I'll forget some key
detail and it'll perform like a dog.

Of course, all this would have much more authority if I'd just finish
off the interface to the DEM 440 transverter :-)

   I will soon be able to recieve packet radio in the Washington, D.C. area
(I'm in New York for the next month). Is there anybody out there in
Washington was could send me a list of the most active channels for 1200
buad packet, lists of digipeters, etc? I'd really appreciate it. Thanks.

AMPRNet IP address coordinators as of 14 April 1993

Corrections and updates to brian@ucsd.edu.

Note: the people listed here have volunteered to issue IP addresses for their areas. They are not paid to do this service; please understand that they are perfectly at ease to deal with coordination responses at a lower priority than the things that matter more, such as job and family. Please be patient when requesting an address.

A DSP board would cost more than the modem! The IF is 455 kHz, +/- 35 kHz
passband, 26 db down at +/- 50 kHz. Dale found the perfect Toko coils to
make an LC filter that meets the spec.

All true, but Dale was designing to cost, not ultimate performance. I
doubt the system you describe could be sold on the amateur market for
less than a kilobuck. It'd be nice though.

The Proceedings of this conference should be available from the ARRL.
they did publish them, and there were over a hundered left after the
Conference.   So, give them a call or write to ARRL HQ!

Geez. We need to add this to the FAQ:
CATV Channel 17   138-144Mhz
CATV Channel 18   144-150Mhz
CATV Channel 19   150-156Mhz

I dunno about Canada, but channel 18 sure looks familiar! ;^)

Hi folks!

I'm new to this group so please don't flame if this question was
asked before.

Since I use waffle (as newsreader) I thought it might be possible
to log into someones computer via packet radion.

Is this possible, anybody with information ??

THANKS to yall!

- Peter

Need Help running BayCom from Windows 3.1

I can not get BayCom 1.5a to run under Windows 3.1. I have tried
running L2 and SCC from Windows and even loading L2 before
starting Windows, but only the SCC terminal software runs and
does not see the BayPac-1 modem at Com2.

I have tried various settings for Com2, and the Advanced options
under the PIF Editor but still only SCC runs.

If anyone is running BayCom from Windows please let me know what
configuration you use to load L2 and SCC and the settings for the
Com port. Do you run BayCom from a PIF and use the Advanced
options to control Memory and Display?

Thanks in advance for your suggestions.

What happens when DVC (Digital Videon Compression) is introduced next
year and instead of just receiving squiggly lines on 2 or 3 channels
we'll be receiving sqigglies on, let's see 3*10 = 30 channels eventually.

Actually, most cable systems will still reserve channels 2 through 30 for
analog (the current system) and 31 on up will be digital. When they all
go digital I'll go to DBS or those 27.5-29.5 GHz square dishes I've heard
about (CellularVision).

I have an old Zenith laptop that I'd like to use with my Baycom modem.
Currently, though, the laptop isn't seeing the incoming data on CTS
correctly (pin 5 on a DB25), although it sends just fine. Any
suggestions on what the laptop might want to be seeing, if not the +5v/0v
that is nominally present?

I've used the Hamtronics TV-2 to feed a SSB Electronics 902
transverter. You can certainly build a better converter for
less money, but it does work. You're right that the LO is
the key to the transverter. A couple of MMICs and an SBL-1
take care of the rest. Getting a clean easy starting LO
is harder than it looks with a minimum component design.

Fortunately, the SBL-1 really wants a square wave drive,
so a packaged oscillator, like those used on SVGA cards,
is a good possibility. Anyone know of a cheap source for
101 MHz packaged oscillators?

Gary

  Yes it does. I think what you mean is that it does not have selective
repeat. Instead it uses go-back-N.

Since the digital transmission schemes include error correction and
concealment, the performance remains about the same down to a very low
carrier-to-noise ratio, below which it degrades very quickly. Hence,
digitally compressed TV is supposed to be less susceptible to interference
than amplitude modulated TV.

The first question I would ask is: Are you trying to use the Baycom-style
modem to run NOS? NOS needs a KISS TNC, the Baycom modem is not quite KISS. I
remember seeing an AX.25 driver for NOS that allows a Baycom-style modem to be
used....I believe it is with NOS304.ZIP (The NOS docs), on ucsd.edu

Let me know what happens, I am interested in using a Baycom-style modem for
NOS. (I am using a TCM3105, but I have an RS-232 to TTL converter on a single
chip!)

Dear All,

    I am trying to get my standard connection going with KA9Q (PA0GRI113016)
and a GVC NIC-2000 ethernet card. I know that my router and modem is
working because I am able to ping, finger, and even telnetd with it.

    However, after a time, it crashes randomly. Help would be
greatly appreciated.

    I suspect that there is a hardware conflict in the PC. I am
running with a 386SX/33, 2 MB Ram. The Ethernet card is configured
for IRQ 5, ports 0x360-0x37F.

    Thanks in advance. I know that it's not much to go on, but I
don't even know what the questions to ask are, sorry.

Please send mail.

Elliott

The following was provided by the Office of the CHIEF NAVMARCORMARS.

QUOTE:

44th ANNIVERSARY OF THE ANNUAL ARMED
FORCES DAY COMMUNICATIONS CELEBRATION

Ref: DoD Directive 4650.2 of 17 Jan 86

1. Purpose. To announce the 44th Annual Armed Forces Day Communications Celebration scheduled for Saturday, 15 May 1993.

2. General. The Army, Navy, Marine Corps and Air Force are co-sponsoring an Amateur Radio Program in celebration of Armed Forces Day per reference (a), featuring the traditional military-to-amateur cross band communications test and message receiving test. The tests give amateur radio operators and short wave listeners an opportunity to demonstrate their individual technical skill and to receive recognition from the Secretary of Defense or the appropriate military radio station for their proven expertise.

a. The proceeding will include operations in continuous wave (CW), single sideband voice (SSB) and radioteletype (RTTY).

b. Participating military radio stations will award commemorative acknowledgement (QSL) cards to amateur radio operators achieving a verified two-way radio contact. Special commemorative certificates will be awarded to anyone who receives and accurately copies the Armed Forces Day CW and/or RTTY message from the Secretary of Defense. All contacts must be acknowledged by QSL card or certificate to validate military interest in these operators.

3. Military-to-Amateur Cross Band Test. Military-to-amateur cross band operations will take place from 15/1300Z (UTC Universal Time) to 16/0200Z (UTC) May 1993. Military stations will transmit on selected military frequencies and listen for amateur radio stations in the amateur bands indicated below. Frequencies assigned below are the "Assigned Frequency". To derive the "Window Frequency" drop 1.5KHZ from the "Assigned Frequency"

for USB.

```
               ex:  4005.0 Khz (Assigned Frequency)
                    -  1.5 Khz
                    ----------
                    4003.5 Khz (Window/Dial Frequency)
```

The military operator will announce the specific amateur band frequency being monitored. Duration of each contact should be limited to three minutes.

4. CW Transmitting. The CW receiving test will be conducted at 25 words per minute. The broadcast will be a special Armed Forces Day Message from the Secretary of Defense to any amateur radio operator or short wave listener desiring to participate. A 10-minute call for tuning purposes will begin at 16/0230Z (UTC) May 1993. The Secretary's message will be transmitted at 16/0240Z (UTC) May 1993 from the following stations on the listed frequencies:

TRANSMITTING STATION	FREQUENCY (Khz)
AAE ARMY HF/MARS Radio Facility Fort Sam Houston, TX	7358.5, 20941.5
AAH ARMY HF/MARS Radio Facility Fort Lewis, WA	6988.0, 10151.5, 20995.5
AAR ARMY HF/MARS Radio Facility Fort Bragg, NC	7309.5

AIR 89th Communications Group Andrews Air Force Base Washington, DC	6995.5, 13997.5
NAM Naval Computer Telecommunications Area Master Station LANT Norfolk, VA	4005.0, 7393
NAV HQ Navy-marine Corps MARS Radio Station Cheltenham, MD	7365.0, 10259.5
NAV-8 DIR NAVMARCORMARS REG EIGHT Honolulu, HI	4008.5, 14820.0
NMH Coast Guard Radio Station Alexandria, VA	4015.0, 7346.5
NMN Coast Guard Communication Area Master Station Chesapeake, VA	7393.0
WAR HQ Army MARS Radio Station Fort Detrick, MD	6998.5, 13992.5

5. Radioteletypewriter Transmitting Test. Two radioteletypewriter receiving tests will be transmitted. The first will be 60 words per minute using 170 hertz (narrow) shift. A 10-minute call for tuning purposes will beginning at 16/0300Z (UTC) May 1993. The Secretary's message will be transmitted at 16/0310Z (UTC) May 1993, and the second will be at 100 words per minute using 170 hertz (narrow) shift. A 10-minute call for tuning purposes will begin at 16/0330z (UTC) May 1993. The Secretary's message will be transmitted at 16/0340Z (UTC) May 1993 from the following stations on the listed frequencies:

TRANSMITTING STATION	FREQUENCY (Khz)
AAE ARMY HF/MARS Radio Facility Fort Sam Houston, TX	7358.5
AAH ARMY HF/MARS Radio Facility Fort Lewis, WA	6988.0, 20995.5

AAR ARMY HF/MARS Radio Facility Fort Bragg, NC	7309.5
AIR 89th Communications Group Andrews Air Force Base Washington, DC	13986.5
NAM Naval Computer Telecommunications Area Master Station LANT Norfolk, VA	4005.0, 7393
NAV HQ Navy-marine Corps MARS Radio Station Cheltenham, MD	7365.0, 10259.5
NAV-8 DIR NAVMARCORMARS REG EIGHT Honolulu, HI	4008.5, 14820.0
NMH Coast Guard Radio Station Alexandria, VA	4015.0, 7346.5
NMN Coast Guard Communication Area Master Station Chesapeake, VA	7393.0
NPL DIR NAVMARCORMARS REG FIVE San Diego, CA	7382.5, 14385.0, 20625.0
NZJ Marine Corps Air Station El Toro, CA	7375.0, 14480.0, 24805.0
WAR HQ Army MARS Radio Station Fort Detrick, MD	13992.5

6. Submission of Test Entries. Transcriptions of the CW and/or RTTY receiving tests should be submitted "as received". No attempt should be made to correct possible transmission errors. The time, frequency and call sign of the military station copied as well as the name, call sign, and address (including Zip Code) of the individual submitting the entry must be indicated on the page containing the test message. Each year, a large number of acceptable entries are received with insufficient information or the necessary information was attached

to the transcription and was separated, thereby precluding the issuance
of a certificate. Entries must be postmarked no later than 25 May 1993
and submitted to the respective military commands as follows:

   a. Stations copying AIR send entries to:

       Armed Forces Day Celebration
       89 CG/DOJB, Andrews AFB
       Washington, D.C. 20331-3645

   b. Stations copying NAM, NAV, NMM, NMN, NPL, NZJ and NAV-8
       send entries to:

       Armed Forces Day Celebration
       HQ Navy-Marine Corps MARS
       Bldg-13 NAVCOMDET Cheltenham
       Washington, D.C. 20397-5161

   c. Stations copying AAE, AAH, AAR or WAR send entries to:

       Armed Forces Day Celebration
       Department of the Army
       U.S. Army Information Systems Command
       ATTN: ASOP-HF
       Fort Huachuca, AZ 85613-5000

Actually the documentation for the original IBM version calls itself C-BBS,
which is because it is a BBS written in C. I wasn't aware that "CBBS" was a
trademark and have been routinely omitting the hyphen from the name.
Sorry about that, but I'd never heard of your CBBS. I'll have to go through my
documentation and change the name.

  >   find it.

  use the "attach ?" command to see if you hve the SCC driver. That works
  best with the DRSI card. If you do have it, then an example attach command
  would look like:

        attach scc 1 init 300 16 2 0 1 0 2 p4915200 8
        attach scc 0 ax25 144 236 d1200 wa6fwi-3
        attach scc 1 ax25 440 236 d9600 wa6fwi-3

  This says base address of 0x300 and IRQ 2. The above example is for a
  type-1 card running 1200 baud afsk, and 9600 baud to an external modem.

Hello,

I am interested in the structure of ampr network, and would like to
take a look at the map of AMPR Backbone at the world top level.

Since I have no direct connecton to Internet, I cannot find it in
any node.

Could anyone who has it put it here ?

Thanks in advance.

Lines: 21

My next project is to come up with an IF/detector module for fast -- 112
to 250 kB/sec -- packet radio use. No fancy modulation scheme, just
wide FSK for use at 902 or 1296 MHz.

I'm a bit familiar with the Motorola 3362 chip, but I wonder if there
are newer designs that might work at higher input frequencies.

My goal is to come up with an inexpensive design for a receiver "back
end" with IF input on one end and an FSK demondulator on the other. I'm
particularly interested in ways to use a higher IF than 10.7 -- do any
current chips work up to, say 150MHz with internal downconversion so a
normal IF filter can be used?

Any suggestions?

John

An article with everything you need to know to make one (including PCB
drawings) was in 73 a few years ago. Can't find the specific reference,
but that's what indices are for...

  What you describe is very close to what I built and described in the 10th ARRL Computer Network Conference proceedings.

  I built 10 watt FSK transceivers at 904 MHz. They are essentially double conversion transverters with digital mod and demod at 29 MHz. The receiver uses the MC13055 which is the same FSK receiver chip I used previouslyu in the 2 Mbps 10 GHz data link I first published in Ham Radio and which is now also in the ARRL handbook.

  The MC3356, which includes a VHF converter section, could also be used at these speeds. There is a newer and perhaps slightly improved design of this (the MC13056 if I remember rightly).

  While using this would have let me reduce the "external" IF count on receive, it didn't really offer all that much help on transmit so I didn't bother with it.

  The radios I built were first designed and built for 512 kbps in a 2 MHz channel but later reduced to half that. These 256 kbps radios actually have done quite well in across-the-bench tests at 384 kbps and speed is pretty much a function of filter design. Handling the data stream is another matter entirely.

  Some of the existing radios are currently deployed on hilltops in a "beacon" test mode. While there is not yet end-end two-way data flow due to lack of resources to debug software for the digital hardware (MIO also shown in the CNC proceedings), data is perfect copy at n6gn. Even

though the data clock is currently at about half speed, the a 2+ kbytes of the test text (chapter 55 of Isaiah) takes only a little over 1/8 of a second.

I've been hoping that someone would get interested enough to step in and get involved in writing code to make the whole thing usable (Borland IDE environment with remote debugging possible as mentioned in the proceedings) but to date a couple of us have been on our own and running low on resources of time, money and energy.

If anyone in the SF bay area wants to check it out there is also a CW ID after the text on the mark side at 904.740 MHz from beacons on Sonoma Mtn and Black Mtn (overlooking Si valley). The antenna is horizontally polarized.

I guess in retrospect my suggestions are that this is a fairly costly approach if the radios are intended for users rather than backbones and you might want to carefully consider your "target". If you can't arrange your paths such that you have complete line-of-sight I think you'll want to address the inter-symbol-interference caused by multipath and probably link C/N budgets if paths are very far from LOS. For more details, see the 10th CNC. I'm currently working on a spread spectrum, direct conversion design to address some of these problems. I'd be glad to help as I can with any design problems.

Version: $Revision: 1.03 $

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

 -- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it was decided to create the group as a moderated newsgroup.

 -- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered presentation in rec.radio.info (even with cross-posting, only one message, with a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:

```
     /Newsgroups:.*[ ,]rec\.radio\.info/h:j
```

either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:

```
     rec.radio.info:!s/:^
```

in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:

```
     sequence
     rec.radio.info
     rec.radio.
```

at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

 -- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier,

and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

   rec.radio.swap may be more deserving of the posting in any matter.

   Similarly, copyrighted material generally cannot be used. If it's TRULY

worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

```
sub address radio-info
unsub address radio-info
```

where 'address' is your full mailing address. Send this request to

```
listserv@ucsd.edu
```

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

```
sub mymailbox@myhost.mydomain.mil radio-info
```
or
```
sub MEMEME01@DMBHST.bitnet radio-info
```

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
  saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the

articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as timely.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
     rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
     rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
     Paul W. Schleck, KD3FU pschleck@unomaha.edu
     Ian Kluft, KD6EUI ikluft@uts.amdahl.com

--

   Hi, There is a small group of user's here in Brisbane Australia thats
 testing 9600 baud G3RUH modems in HALF-DUPLEX mode for a user-level onto
 a main back bone. Can anyone help with known PARAMETERS for HALF-DUPLEX
 mode @ 9600 baud, we have been starting around with the param's within
 the G3RUH paperwork but the through put seems very poor. Any help would
 be very much appreciated.

 Thanks in advance..

 Andy Joyce VK4KIV.

   I checked an internet mods server and didn't see any mods to set up
a Kenwood TR-7950 for 9600b operation. Does anyone have the mod for
that? Does anyone have any experience with 9600b with the TR-7950? I
believe that the TR-7930 is the same rig, but has less output, so mods
for that rig should be ok too. Thanks.

Organization: KD4NC HAM Packet Radio Gateway
Date: Mon, 19 Apr 1993 03:15:17 GMT
Lines: 29

GRAPES will be represented at the Dayton Hamvention in Flea Market
space 3341 and 3342.

KD4NC, KD4APM and KE4ZV will be at the flea table (off and on as usual),
speaking of 56K, packet networking and other topics (nothing new, really)...

We WILL have kits available at the Hamvention.

We're expecting guest appearances from the Ottawa group (Doug Yuill,
I have your kits ready) possibly with PI cards ????.

No plans for demos (wasn't sure if Phil would be available to fix
the generator :->   )

Not to take away from the TAPR booth as a gathering space (we'll be
visiting there often to see who comes around).. but we
would like to visit with fellow
packeteers/experimenters/network builders/USENETr's.. Stop
by and visit us when you are trudging around in the flea market...

We also look forward to meeting up with fellow packeteers at McNasty's
on Saturday night...

BTW, If ANYONE see's any 220 or 430 transverters for sale, PLEASE PLEASE let us
know...

Better packet reception

How about this method for improving packet reception (probably has been done, but here goes anyway). Sometimes, when noise causes a few errors in a received packet, the CRC rejects the packet and tells the transmitting station to resend it. If the noise persists, you are in for a lot of retries, and thruput is bad. Let's say, for example, that the received packets have about 5 errors.

Suppose the receiving TNC stores the bad packet. and if the next try is also bad, store it. And if the third try is also bad, you could compare all three, byte by byte, and look for where they differ. Errors should be at random spots in relation to each other in the 3 stored bad retries. You could do a reconstruction of a (hopefully) good packet by noting, on a byte by byte basis, which two of the three match, and use that value in the reconstruction. (If all three are different, you have to ask for a 4th retry, but that shouldn't happen too often, or if it does, the channel is really bad!). After you reconstruct a packet, do the CRC to verify it. If it passes, then you tell the transmitting station that you received it OK, and send the next new packet. Transmitting TNC needs no mods, just the recieving TNC can be modified. Transmitter doesn't even know that the receiver has this.

example packet retries:

```
1  The quick brown dof jumps over the lazt fox.  CrC
2  Tye quicj brown dog jumpa over the lazy f0x.  CRC
3  The quick briwn dog jumps ocer the lazy fox.  CRC
    ^      ^   ^     ^     ^  ^          ^  ^     ^
```

places where 1 of 3 do not match, use the character which has a pair matching.

```
R  The quick brown dog jumps over the lazy fox.  CRC
    ^      ^   ^     ^     ^  ^          ^  ^     ^
replaced characters.                             *
```

* (I realize that the CRC doesn't look like this, but I just wanted to illustrate the possibility of reconstructing it as well)

The algorthym would probably be: look for a matching pair, then use that character. Don't care if the 3rd character matches or not. Maybe measure amount of all 3 match to evaluate s/n and confidence levels. Then do a CRC on the reconstruction using a reconstructed (if necessary) CRC value. If still bad, ask for a 4th retry, and look for a pair out of the 4 values at that position that had no pair before, or try to make a new CRC and use it.

Don't know if this is usually done ("Don't you know that this is called 'digital blah blah ba blah', anyone who had 'Packet 101 knows that!"), or maybe the extra s/n margin this would buy is too small to be worth the trouble? It's just some more code in the TNC's EPROM, and a little more use of scratchpad RAM, which room probably exists already without increasing parts count or cost. Just an increase of the time for someone to write it.

(No, I don't have the programming skills to try this myself, unfortunately).

GEC/Plessey specify a series of FM demodulators (SL1454 etc) for use in
satellite TV receivers : 150 or 600MHz in, 10MHz of baseband video out.
I think there's also a related data slicer / clock recovery circuit intended
for use in DMAC decoders, though that isn't used in the most common
implementation - it may not be in volume production.

The most easily available components probably vary with local satellite
standards, and I think the european systems vary rather widely from those
in the US - so it may be worth investigating locally-available receiver
designs to find out what's in common use.

>rec.radio.amateur.antenna   discussion of amateur radio antennas
There is the act of rdfing and then there is the equipment. equipment will
grey area into .antenna or .equipment AND .rdf. (Not a
disagreement with the proposal, just half hearted support :-)

>rec.radio.amateur.operating   Operating procedures and questions: DX,
>   CW, contests, propagation, repeaters
> alternatives proposed: r.r.a.dx and r.r.a.repeaters
The .repeater group will degenerate (poor word!) I think into not much
different than .policy discussions. I'd stick with .operating with a good
short FAQ saying that .dx discussions are greatly welcomed (as the name
could add confusion for the .dxers, but much of what they will say WILL
be salient to operating procedures).

>Issues currently under discussion
>---------------------------------
>The following issues and notes relate to the discussions listed above:
>* a place for beginners to ask their typically-unfocused questions
> suggestions: r.r.a.beginner (markz/jbloom/emd)
> concerns: r.r.a.instruction allows enough room for license upgrades as well
>   and r.r.a.beginner will have the same questions repeatedly (pschleck/
>   ikluft/jgt10/kevin)
If I was a newbie on both USENET and Amateur Radio, I'd go to .misc first.
I am not sure we can focus beginners into any specific group, and once they
are less green under the collar, participation drops off quickly.

> results so far: only the name is in dispute, beginner or instruction will
>   be on the CFV. r.r.a.instruction is slightly ahead - can everyone live
>   with it?
.instruction since it encompasses more.

> results so far: only the definition is in dispute, dx or operating of some
>   sort will be on the CFV. r.r.a.dx and r.r.a.operating seem to ruffle the
>   fewest feathers - can everyone live with them?
I'd be saddened to see the .dx crowd not imparting their operating procedure
know how ;-) , but yes, this proposal (I don't support the split of this group,
but this split sounds the best).

> To break the deadlock: can you live with r.r.a.construction? If not,
>   should we roll up products/construction/technical and call them
>   r.r.a.equipment? (That seems to fit the theme everyone is arguing over.)
I rest (what, you think you have worn me out! :-) and support .equipment
as the meta for products/construction/technical/tech/homebrew/.shack (<---hmmm)

If the error rate is relatively low, you probably don't need to get the
third try. Just create a third packet, trying data from both of the faulty
packets until the CRC checks out.

>(No, I don't have the programming skills to try this myself, unfortunately).

This *is* a familiar approach. It fails when the packets aren't framed
correctly, which unfortunately is very common on the noisey channel.
This will shift the relative byte positions one or more bits left or

right. This makes the comparison impossible unless you have the horsepower
to do shift and compares across the length of the packets. This is one of
those n^n computational problems. It *is* simple in that it will work with
ordinary packet stations, but it doesn't work often enough to be robust.

A much stronger system that uses a different version of FEC is
computationally possible. Bit errors tend to come in batches
due to the nature of the channel, so if you arrange the packet
so that adjacent bits aren't transmitted in sequence you can
"smear" the error out in such a way that simple error correcting
codes can reconstruct it. To do this you prepare the packet by
reading it into the rows of a matrix, attaching a simple Reed
Solomon FEC to the end of each row. You then read the data out
for transmission by columns, attaching a RS FEC to the end of
each column. On receive you read the data back into a matrix
by columns, do the FEC calculations, repair damaged bits, and
read the reconstructed packet out by rows. Though this sounds
more complex, the computational requirements are less, log(n),
than the misframed case for the other method. It does require both
stations to cooperate in using the method. This is the method
used in digital video recorders to deal with "dropouts" in the
magnetic media, similar to RF noise bursts. It's amazingly robust.
The FEC adds some overhead, but since resends become rare, it's
thruput is better.

In pure gaussian noise, a soft decision bit slicer can enhance
operations even more, but it fails to be useful in the presense
of strong non-gaussian interference.

Hello Amiga Packet people.

I'm looking to break into Packet myself....and I was reading through CQ,
and saw an ad for PackeTerm.

Has anybody out there used this program? If so, can they post or send me a
quick review of the product?

I'd also like pointers to other Packet related products for the Amiga.

FEC of a form. I would even go simpler than that, I would take *any*
differences and try them all (why look just for pairs that match). The only
(slight) problem is that you are increasing the chances of receiving a packet

full of errors as if it was correct (Data wrong, CRC sez not). There are also cases of bit slipping too (loose a bit) that could get your mind wandering.

I did something like this with passall-on and let the confuser reconstruct traffic on the channel from the ascii streams. I did *not* see any improvement of copy (and I took a performance hit on the box as it was slow already), but that is probably due to the fact I was monitoring rather than being an active participant (and the fact I did not have access to the CRC) ...

Now, the `technical' problem. The TNC has NO idea what the CRC is, since the Synchronous UART strips that off before presenting it to the CPU. It is possible to tell the UART to not do the CRC stuff, but that is a big change to the software operation of the TNC (Any Z-80 based TNC). I believe the KAM's processor has good access to the CRC, but with their support, and our lack of source code ...

Ok, who is going to add this to their KISS firmware first?

Does anyone know if a source for the TCM3105 modem chips (as used in the
Baycom and my PMP modems)? Ideally, something that is geared toward
hobbyists: small quantity, mail order, etc.

For years, we've been buying them from a distributor (Marshall) by the
hundreds for PMP kits. But orders have dropped to the point where we can
no longer afford to offer this service. And all of the distributors I've
checked have some crazy minimum order ($100, or so).

I'd like to find a source for those still interested in building PMP kits.
Any suggestions?

It really depends how strong the CRC is. You could easily get an erroneous
packet which checks out against the CRC. Furthermore, the kinds of errors

you get may cause the receiver to lose sync with the incoming data and
not receive anything at all until it sees another flag. You can't just
store a fragmented piece of a packet without a lot of special effort.

FEC packet would work more easily with less magic; you just program your
TNC to send every packet twice. Heck, rather than using a long TXD you
could a very short TXD and send the packet twice. The TX Delay time is
simply wasted time to let someone's receiver warm up. Sending the
packet twice would give slow receivers a chance to warm up and give
the quick receivers (i.e. people using DCD State Machines) two chances
at reading a noisy a packet....

In packet-radio digest No. 91, Dave Rasmussen asks,

>How do the PacComm "Baymod-9" or Baymod-2" compare with this
>Tigertronics BayPac BP-1 that looks about the size of a DB25
>gendermender, and what's the difference between the first 2?

Actually, the PacComm models are Baymod-9 and Baymod-25 and the
difference is that one has a 9-pin serial connector and the other has a
25-pin connector.

PacComm's units come with a copy of the latest version of Baycom software
and a printed manual, which accounts for the difference in price.
Tigertronics supplies the older firmware version of Baycom software.

In packet-radio digest No. 91, pipex!sunic!celsiustech.se!admin.kth.se!kth
.se!lysator.liu.se!pme@uunet.uu.net (don'tya just love these addresses?)
asked:

>I need spec for NETROM and KISS mode.

To my knowledge the NETROM spec is only available in the NETROM manual
which comes with NETROM eproms from Software 2000. It is copyrighted,
and as we all well know, the author is legitimately concerned that his
copyright be respected. If the specification is available separately,
that would make sense, but I am not aware of it.

The KISS specification was published in an early ARRL Computer Networking
Conference proceedings and is probably available at many sources. If you
cannot find a ftp source, it is available from the fileserver at
tapr.org. Send a message to file-request@tapr.org with the commands
HELP
DIR
QUIT
on separate lines and you will receive sufficient information to request
this file. There are several other files available there as well,
including information on TAPR membership and kits.

In packet-radio digest No. 91, netcomsv!gnct!thomason@decrl.dec.com asks,

>Is there any pocket sized KISS compatible TNC ?

TASCO in Japan makes a model u24, which is an improvement over the old
Heathkit Pocket Packet TNC. It is not available in the U.S., but in
VS6-land, things are probably different.

At the 1992 Dayton HamVentionm, Communications Specialists had brochures

for what sounded like it might be the same unit (TASCO does provide some
OEM equipment), but I have never heard any more about this.

Other possibilities (slightly larger, but if you have big enough pockets,
they will fit) are the TASCO TNC-211 and PacComm Handi-Packet.

All of the above support KISS.

The operating code for the PK-87/88 is different than that for the TNC-2s.
NetRom code is available from Software 2000 for the TNC-2 and a different
version is available for the PK-87/88.

There are claims that NordLink stole the code for the TNC-2 although the
counter claim is that they reverse engineered it. Interestingly enough,
they haven't reverse engineered the PK-87/88 code yet.

Also, the wa8ded hostfirmware is in the public domain and is used to run
a tnc in the host mode for various third party applications. The original
version was limited to 4 virtual channels, the newer versions allow up to
32. Hostfirmware is available for both the PK-87/88 and TNC-2 types.

1993 ANNUAL SPRING HAMFEST

sponsored by

Bergen Amateur Radio Association (B.A.R.A.)

Saturday June 5, 1993
8:00 AM till 2:00 PM
Rain or Shine

To be held at:

FARLEIGH DICKINSON UNIVERSITY
Teaneck, New Jersey

Featuring

Amateur Testing
Novice thru extra
8:00 AM to 10:00 AM Only
Exam information - contact Pete K2MHP (201) 796-6622
(No calls after 10 PM)

Bring Original FCC License and a photo-copy
VEC charge $5.25

Food and Snacks

$2.00 ADMISSION

.Children under 12 FREE
.Lots of Parking
.Rest Room Facilities
.Refreshments

Vendor Space

.$10 outdoor tailgating per space

Talk-in on 146.19/79 & 146.52 simplex

For vending space reservations and Hamfest Information -
contact Jim Joyce K2ZO (201) 664-6725
(No calls after 10 PM)
286 Ridgewood Blvd. No.
Washington Twp., N.J. 07675

Directions:

From the West....

Take Garden State Parkway to exit 161 (Route 4 EAST).
Take route 4 East to RIVER ROAD - FARLEIGH DICKINSON exit.
follow signs to parking area.

From NYC ....

Take George Washington Bridge to N.J.
take Route 4 West to RIVER ROAD - FARLEIGH DICKINSON exit.
follow signs to parking area.

Or rather, 13 to 7 or 8 in real numbers. I think you'll be amazed at
the number of folks waiting in the wings to vote a resounding NO (of
course, I could be amazed by the number of folks just waiting to vote
YES too..) I am singularly unmoved by the "it worked in rec.autos,
rec.aviation etc arguments - is there a guerilla force that moves from
group to group dreaming up splits ? Where to next ?

FWIW - I also think .info was a total waste of time, Paul Schleck (apologies
if I mis-spelt your name) explained the rationale to me ("kill file hack").
I still can't hack my kill file to make it work, and I suspect there
are many more like me...

20 or 21 replies seems to me like a poor response for a request for
a QSL route, let alone a reorg RFD.

   Enough talk, time to get started. We are undertaking what I envision
   as the next generation of BBS. It offloads a lot of the user interface
   and work to the users pc as opposed to the BBS itself. This is often
   described as the client/server approach.

Sounds a lot like LZW and NNTP to me.

I had the same question as the original poster, but after reading
about the GRAPES modems, I don't think they're really for anyone
except those interested in tinkering and designing the modems.
I think it was ve3jf's article that described all the problems

in finding suitable transverters, the need to build/buy/find
bandpass filters for the front of these, the susceptibility
of the transverters to noise from other nearby equipment, ect, ect.
The fastest "off the shelf" solution I've been able to locate are
the Kantronics UHF data radios which do 19.2k. Clearly not
56k, but you can buy all the pieces complete and you don't
have to have a bench full of test equipment to get it working. ;)

Oh well, someone, please tell me there is a better/faster solution.

Regards,
Chris

>are many more like me...

You've spelled it right. What newsreader are you using? The ability to
kill articles cross-posted to a certain group is a hallowed feature on

most major newsreaders.

In rn, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:

/Newsgroups:.*[,]rec\.radio\.info/h:j

either in News/KILL (if you don't want to see rec.radio.info articles anywhere) or News/rec/radio/amateur/misc/KILL (if you don't want to see them in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:

rec.radio.info:!s/:^

in .nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:

sequence
rec.radio.info
rec.radio.

at the end of .nn/init in order to see all the rec.radio.info bulletins first, then read rec.radio.amateur.misc without the bulletins.

Personally, I read rec.radio.info, and use the sequence technique with:

rec.radio.info:!n:Cary Oler

in my .nn/kill file (nothing personal Cary, just not interested in Solar Reports :-).

I'd certainly be willing to work with anyone who wants to set up such a scheme to customize their presentation of the rec.radio.* groups, even if they are using a reader other than nn or rn (rec.radio.* groups only, please, I don't have time to give kill-file help to the entire net).

Or rather, 13 to 7 or 8 in real numbers. I think you'll be amazed at
the number of folks waiting in the wings to vote a resounding NO (of
course, I could be amazed by the number of folks just waiting to vote
YES too..) I am singularly unmoved by the "it worked in rec.autos,
rec.aviation etc arguments - is there a guerilla force that moves from
group to group dreaming up splits ? Where to next ?

FWIW - I also think .info was a total waste of time, Paul Schleck (apologies
if I mis-spelt your name) explained the rationale to me ("kill file hack").
I still can't hack my kill file to make it work, and I suspect there
are many more like me...

20 or 21 replies seems to me like a poor response for a request for
a QSL route, let alone a reorg RFD.

I had the same question as the original poster, but after reading
about the GRAPES modems, I don't think they're really for anyone
except those interested in tinkering and designing the modems.
I think it was ve3jf's article that described all the problems
in finding suitable transverters, the need to build/buy/find
bandpass filters for the front of these, the susceptibility
of the transverters to noise from other nearby equipment, ect, ect.
The fastest "off the shelf" solution I've been able to locate are
the Kantronics UHF data radios which do 19.2k. Clearly not
56k, but you can buy all the pieces complete and you don't
have to have a bench full of test equipment to get it working. ;)

Oh well, someone, please tell me there is a better/faster solution.

Regards,
Chris

>are many more like me...

You've spelled it right. What newsreader are you using? The ability to
kill articles cross-posted to a certain group is a hallowed feature on
most major newsreaders.

In rn, according to Leanne Phillips in her rn kill-file FAQ, add a line of
the form:

/Newsgroups:.*[,]rec\.radio\.info/h:j

either in News/KILL (if you don't want to see rec.radio.info articles
anywhere) or News/rec/radio/amateur/misc/KILL (if you don't want to see
them in rec.radio.amateur.misc). The latter method means your kill file
will only be consulted during rec.radio.amateur.misc (and hence runs
more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:

rec.radio.info:!s/:^

in .nn/kill (if you don't want to see rec.radio.info articles anywhere),
or put the following lines:

sequence
rec.radio.info
rec.radio.

at the end of .nn/init in order to see all the rec.radio.info bulletins
first, then read rec.radio.amateur.misc without the bulletins.

Personally, I read rec.radio.info, and use the sequence technique with:

rec.radio.info:!n:Cary Oler

in my .nn/kill file (nothing personal Cary, just not interested in Solar
Reports :-).

I'd certainly be willing to work with anyone who wants to set up such a
scheme to customize their presentation of the rec.radio.* groups,
even if they are using a reader other than nn or rn (rec.radio.* groups
only, please, I don't have time to give kill-file help to the entire
net).

   I'm leaning in this direction too. $350 seems a bit steep for a 10 watt crystal rig. (If anyone know where to get them for less, PLEASE let me know.) I believe that these radios will talk to each other at 19.2kb with out a modem OR you can use a 9600b modem running at 19.2kb.
   Can someone with some VHF radio design knowledge explain what's so hard/expensive in designing a high-speed capable radio? To go at 9600B and higher, you have to bypass a lot of circuitry that is used for voice communications and can't be used for packet. How come it seems like its more expensive to not include the voice stuff, than it is to include the voice circuitry? Why can't we design a $50 high speed packet rig? If this is an ignorant question, please enlighten me.
   For modems, I call G3RUH sending out a message saying that his modem's were capable of going up to 64kb. It's curious that I haven't heard anything else about that. I know that the standard, G3RUH modems will do 19.2KB and higher. Both PacComm and MFJ use G3RUH designed modems, so they'll go > 9600b.
   Lastly, I recall someone saying that they were running the D4-10 rigs at 38.4kb. I'd like to know if you can use a G3RUH modem running at 38.4kb with the D4-10. Do any mods need to be made to the D4-10? If anyone has any details on that, please let us know.

Well, ok, the wa4dsy modem is not plug n play, but let's ease up on the "bench full of test equipment" claim. I got mine going in in about 3 or 4 evenings - including building it - with just a scope. I'd be surprised if most people in the hobby don't at least have access to a scope. More importantly, once built and aligned they are rock solid, no adjustments have been needed on any of ours, which have been in service for years.

Transverters are another story I suppose. Too bad Sinclabs got out of the business. I heard that a small Toronto company was going to resume production of that design, but I haven't heard more yet.

Dave

Why wait for the next generation. First optimize the use of the LAN,
local messages need not be left on the central BBS. Second, smarten
up the use of the BBS by automating user connects. Treat the BBS and users
as a distributed system.
Such user software already exists and can be interfaced to existing BBSs
in the client (user) server (BBS) mode, or think of it as a front end to
the BBS. Try LAN-LINK. It can be FTP'd from ucsd.edu.

`There is a company in Florida called PacComm that makes what is called
`a HandiPacket TNC which includes standard TNC2 commands, a Personal
`Message System electronic mailbox, and has KISS capabilities. It runs
`on batteries and has a good life there upon.

Thanks for you reply.

Do you know how much for a PacCom ?
Where is the Vendor's address ?

`Also if you are interested, I have the roms for the old HK-21 heath
`pocket packet on file from when Tasco picked up the line and expanded
`the PROMs to have KISS mode included. No documentation with it, and you
`have to do a software reset, else a hard reset from within.

I am new to packets.
What is HK-21 heath pocket packet ?
Where can I get it ant what is price ?

`I would be interested to know if you have any good places to get a
`Heath HK-21 fixed. (or a new one cheap) In the process of my testing and
`playing with mine, I broke the bus connections. When trying to fix that,
`I fried it somehow....

BTW, what do you think the best magazine is ?

I'm intersted in getting into packet radio but am afraid of the cost and jumping right in. I curently own a scanner (of the handheld style) and was thinking that there must be some way to hook up the scanner to a PMP kinda deal to be able to recieve and watch the packet channels. I can do my own electronic work and would be willing to do scanner mods. Basically I'm looking for the cheapest way to convert a scanner to read only packet on my PC. Is there any hope?

Hi,

  I was just contacted by a Belgian ham via postal mail. He wrote his
call sign as ONL4456. Can this be valid? The ON prefix looks right for
Belgium, but a four number suffix? And the length of the call sign is
seven characters! How would a call like this work in ax.25 which has
room for only six characters plus ssid? Do they run something different
than the standard ax.25 in Belgium?

I don't see how anything I've written on this subject could have given
you this impression! The modem is relatively simple to build, and the
only piece of test equipment needed to tune it up is a dual-channel 'scope.
Construction tends to be time-consuming, since you have to provide the
packaging, inter-board wiring, +/-5V supplies, etc... but it's *not*
difficult. Once you have that done, the rest can be close to plug 'n
play: acquire a transverter (admittedly some of the sources of these have
dried up, but how about Down East Microwave's spiffy new DEM432, available
in wired or kit form?) and a suitable synchronous interface board (I'll
refrain from advertising here :-), lash 'em up, and off you go. Yes, you
may need a frontend bandpass filter, depending on your environment, but
that shouldn't be a show-stopper. It's not a trivial project, but it's not
that tough either... many of us have found the effort to be worthwhile and
rewarding.

Good question - rephrased "where did this idea come from?" It came from the zillions of times we've seen large numbers of posts crying to split the newsgroup because the traffic level is too high. At the last large surge on that topic we invited anyone who wanted to participate in a mail list to determine if a split was needed and, if so, to come up with the RFD. The people who chose to participate in the mail list did exactly that.

You can download the transcript of the discusison from ftp.amdahl.com in /pub/radio/amateur/rra-reorg.log.1.Z (160K+ uncompressed.) That's the same directory where the FAQs can be found

>20 or 21 replies seems to me like a poor response for a request for
>a QSL route, let alone a reorg RFD.

Whoa!! You're changing the units on those numbers... those were 28 people in an ongoing discussion on news.groups. That was a lot more than one "reply" per person. To avoid any appearance of skewing the numbers, I presented the numbers of people instead of the numbers of articles on each side. That way, people can be very vocal and still only count once, no matter which side they're on.

BTW, those numbers have grown significantly since then. The margin continues to widen in favor of a split.

Considering how many people actually participate in discussions on news.groups, these numbers are not insignificant. There will definitely be a CFV. Just plan to vote when it arrives.

I monitored STS-56 SAREX today (4/10/93) at 1645 UTC. This is the
first pass I've listened to where SAREX was active. The QSO numbers
I saw started below 100 (95 or so). This would appear to indicate that
the experiment was turned on shortly before the pass, possibly
around 1600-1630 UTC.

No luck getting the QSO this time; I got the connection UA,
but the bird fell below the horizon before I could establish
the QSO #.

Good luck!

As another member of the ever-present Ottawa group that built
and put on the air a 56 kbps GRAPES modem, I'll also concur
that getting on 56k isn't that difficult. The modem is
easy, and can be done, without a 'scope if you have to.

I built my modem at home and then did the final alignment
on the bench at work (really needed very few tweaks
on the bench with the scope).

The transverters were another matter, but being the last one
to join the group I had little choice on the band to operate on
and had a great deal of difficulty finding a transverter that
worked. Once I did I was on the air in about 5 min.

I would suggest that anyone getting into the 56k game pick
a band(s) where there is readily available equipment (unless
you *really* want to build your own convertors).

No it's not quite "plug-and-play", but the documentation is
good, and there are lots of experts (now) on the net.

Ian

It's not that bad. The GRAPES modem is a kit, and you do need access
to a dual channel scope capable of XY display up to 100 kHz to tune
it up. But it's not tricky. You diddle three pots to get a symetric
circle with inscribed square display. Once it's set, it's very stable.

You do have to supply your own case, power supply, and transverter.
I use standard LMB boxes for cases, small cheap +/- 5 volt switching
power supplies are available at nearly any surplus outlet, and
transverters are still available from a couple of sources. We're
still finding Microwave Modules units at hamfests though new units
are unavailable because they went belly up. Sinclabs quit making
their copy of the MM units also. But, the new Down East Microwave
units work, and so do the SSB Electronics units. Any linear tranverter
you can find can be hacked to work, or you can build the one described

in a recent QST. Filters are only an issue if your transverter is
very broad and if it is located at a high RF site like a mountaintop
repeater location. For home use we've never needed any extra filtering.

The modem was designed to be as flexible as possible. The transmit
and receive sections are totally separate in order to allow split
site or full duplex usage. That's why we don't include a standard
case or power supply. Note that the modem is a MSK synchronous
modem operating at RF for minimum bandwidth consumption. It isn't
only for packet. We've used them to transmit digitally encoded voice
and telemetry streams as well as using them for packet. The RF
frequency was chosen to be compatible with the largest number of
transverters so you can put the final output on any band where
the speed is allowed. We've tested them on 222, 440, 902, and 1296
with various transverters.

Yes, the D4 is an off the shelf solution, but it consumes more
bandwidth per baud since it's direct FSK, and has poorer weak signal
and drifting signal performance than the GRAPES unit. The GRAPES modem
can track signals +/- 5 kHz with no degradation in performance, and
can track out to +/- 20 kHz before significant impairment of performance
occurs. This is because of it's unique tracking data detector design.
The D4 is factory built, but you still need a UHF service monitor to put
it on channel. You can set the GRAPES unit with a 10 meter receiver.

>include the voice circuitry? Why can't we design a $50 high speed packet
>rig? If this is an ignorant question, please enlighten me.

The tricky part is to get a phase linear IF filter for the required bandwidth. That was the most difficult part of the GRAPES modem design. You need a filter that is very phase linear across it's passband, but that has very good adjacent channel rejection. A data radio is different from a voice radio. The non-linearities that don't matter for narrow voice signals can really screw up data transmissions.

Other critical areas are the slicer, which has to deal with off frequency signals, and the scrambler that removes any DC component to the modulation. A DC component can corrupt data slicing at the receiver by effectively shifting the transmit center frequency.

A high speed data radio for packet also has to have very quick TR time or much of the channel time will be wasted waiting for transmitter and receiver to settle. With radios using a single synthesizer, this is very tough to do. With crystal controlled radios it's much easier, but there are still subtle problems to be overcome. The best approach, and the one GRAPES chose, is to use totally separate transmit and receive strips that always run. Then the only TR timing involved is in switching the antenna. PIN switches can do that rapidly.

Sure. Just lock the scanner on the packet frequency and connect an audio
cable from it's earphone jack to the TNC and you're done. The RF performance
of scanners is poor compared to good ham equipment, but it should be
adequate to monitor local activity. If you can hear packet, a TNC is
likely to be able to decode it.

Yup, this works fine. We were doing it yesterday actually. There is
no reason why you'd have to modify the scanner at all, just hook it
up.

  I have a friend that runs some packet BBS programs in the Philadelphia
area. Just recently, the cable company stopped by to identify that he
has been interferring with Channel 18 cable TV. This happens to be the
fundamental frequency for the entire 2 meter band. Although the cable
company acknowledges that he is completely within the legal limits, he
expects that the cable company is getting ready to finger him with his
neighbors and start a neighbor-to-neighbor war. The actually problem
area seems to be confined to within about 500 to 1000 ft (just a few
city blocks from his transmitter). Supposably, the FCC has already been
contacted, however, he hasn't seen or heard from any FCC officals
yet.

Supposably, the problem has been getting worse, he hasn't changed anything in over a year. I figure that the only way the problem is getting worse is that the cable is degrading, and his packet activity is keeping the packet transmitters on more often. Some of the cable ready televisions may also not have the proper shielding also internally and accepting some of the signal directly.

It seems to me that the cable TV industry decided to use the same frequencies in the cable that are used as many other ham and/or commercial frequencies outside the cable, and now that leakage/acceptance is occuring, they don't know how to deal with the monster they've created, or their irate customers (who probably are demanding refunds).

Has anyone else around the country had a problem like this? If so, please send me some mail (not netnews) about what you had to do to resolve this. The more detail you put in your reply, the more I'll be interested in reading it and passing this on to others that may also benefit by it.

Thanks.

I thought I'd summarize the answers I'd received, one even from one of the authors of Baycom which is copied below...

---

just get to the F10-Screen, type :W <Filename> and all the stuff coming
on the monitor screen is transferred into the file.
If you want to print them: Just type :W prn.

Best regards

  This is true. In fact, the was a 'false mod' that would supposedly increse
  the receive frequency range that would actually trash your receive
  circuits. Do NOT try any mods that you see, unless you can afford a new
  radio.

cy
Subject: rec.radio.amateur reorg/RFD discussion summary 4/11
Message-ID: <bbCg03lmcfJF00@amdahl.uts.amdahl.com>
Date: 11 Apr 93 12:21:36 GMT
Followup-To: news.groups
Organization: Amdahl Corporation, Open Systems Development, Santa Clara CA
Lines: 186

This article contains 5 subtopics:
     Current Status of the Discussion
     How to Participate in the Discussion
     Summary of RFD proposed newsgroups (Option I)
     Summary of RFD proposed newsgroups (Option II)
     Notes from the discussion so far

Current Status of the Discussion

The RFD (Request for Discussion) for the reorganization of rec.radio.amateur
was posted on March 26 to news.announce.newgroups, news.groups, and all the
subgroups of rec.radio.amateur. A summary of the proposed newsgroups can be
found later in this article.

We have passed the half-way point in the 30-day discussion period. Current
tallies of opinions posted to news.groups are as follows:

in favor:	25 people	93 articles
opposed:	14 people	30 articles
undecided or unclear:	10 people	18 articles

(the "unclear" category only includes replies that were off the subject)

These numbers may seem small by UseNet standards but it has actually been one
of the larger of many ongoing discussions on news.groups. Support has been
running around the 2-to-1 in favor area since the discussion started. Due
to the support expressed, we expect that it will be possible to issue a CFV
(Call for Votes) some time after the end of the discussion period, which will
conclude on April 26, 1993.

How to Participate in the Discussion

If you have not yet expressed an opinion on the proposed split, you can make it easy on yourself by just replying to this article onto news.groups (the Followup-To line already specifies that for you) and say

    I support the reorganization of rec.radio.amateur

or

    I do not support the reorganization of rec.radio.amateur

YOUR REPLY MUST BE POSTED TO NEWS.GROUPS IN ORDER TO BE AN OFFICIAL PART OF THE NEWSGROUP CREATION PROCESS. You may cross-post to rec.radio.amateur.misc if you prefer to.

It would be even more helpful, if you support the split of r.r.a.misc, to indicate which option from the RFD that you prefer. It's OK to say you like both. They are summarized below. You can still make things pretty easy for yourself by only posting

    I support the reorganization of rec.radio.amateur (Option I)

or

    I support the reorganization of rec.radio.amateur (Option II)

or

    I support the reorganization of rec.radio.amateur (either option)

Here's a question to ask yourself as you consider these proposals:
  Which proposal would make you more likely to vote for all the newsgroups
  when voting time arrives? (Separate concurrent votes will be held for
  each newsgroup in accordance with the newsgroup creation guidelines.)

Summary of RFD proposed newsgroups (Option I)

(all groups unmoderated)

Newsgroup name	description
rec.radio.amateur.misc	all Ham radio topics not covered below i.e. video, stories, humor, new topics [no modification to existing newsgroup]
rec.radio.amateur.policy	regulations & policy issues [no modification to existing newsgroup]
rec.radio.amateur.digital.misc	packet radio & other digital modes [includes old rec.radio.amateur.packet]
rec.radio.amateur.digital.tcp-ip	TCP/IP via packet radio
rec.radio.amateur.operating	Operating procedures and questions: DX, CW, contests, propagation, repeaters
rec.radio.amateur.products	manufactured equipment, modifications
rec.radio.amateur.instruction	Ham radio instruction & examination
rec.radio.amateur.construction	homebrewing & experimentation
rec.radio.amateur.space	amateur radio in space: satellites, earth-moon-earth (EME), shuttle, MIR
rec.radio.amateur.emerg-services	emergency services: RACES, ARES, NTS

Summary of RFD proposed newsgroups (Option II - "the .tech option")

(all groups unmoderated)

Newsgroup name	description
rec.radio.amateur.misc	all Ham radio topics not covered below i.e. video, stories, humor, new topics [no modification to existing newsgroup]
rec.radio.amateur.policy	regulations & policy issues [no modification to existing newsgroup]
rec.radio.amateur.digital.misc	packet radio & other digital modes [includes old rec.radio.amateur.packet]
rec.radio.amateur.digital.tcp-ip	TCP/IP via packet radio
rec.radio.amateur.operating	Operating procedures and questions: DX, CW, contests, propagation, repeaters
rec.radio.amateur.emerg-services	emergency services: RACES, ARES, NTS
rec.radio.amateur.tech	Technical discussions about Ham Radio: construction, theory, examinations, video

Notes from the discussion so far

The following notes may help you determine if any suggestions you are considering have already been discussed. Your opinion is important so be sure to show your support or opposition and make any suggestions you believe would help make this a better, more successful proposal.

* There has been strong agreement that r.r.a.misc has too much traffic.
* One of the main points made by those opposing the split has been a concern that there may be a lot of cross-posting of articles across the proposed newsgroups. r.r.a.policy was commonly used as an example.
* Rebuttal to the cross-posting argument pointed out that even in r.r.a.policy there is currently very little cross-posting. With numbers to show this was a misconception, one person withdrew opposition and began supporting the split.
* A point made by proponents of the split was that r.r.a.policy is not a good comparison. All the proposed newsgroups were modeled after r.r.a.packet, which was made for a subject that many Hams are interested in. r.r.a.policy was just a place to throw away an unwanted subject. Still others said that r.r.a.policy has plenty of ongoing policy-related discussion and has also worked pretty well.
* On the subject of cross-posting, there has been some discussion about a netiquette guide like that found on rec.aviation for the past several years. The idea may be considered regardless of the result of the vote.
* Some concern was expressed by both supporters and opposers about the Info-Hams mail list. A common concern was that the mail lists will need to match the newsgroups in order for this to work. Comments from Brian Kantor indicated a wait-and-see position. He did not rule out making new mail lists if the newsgroups pass but he is understandably not enthusiastic since he

has plenty of other work to do.
* Two people questioned why the proposal includes making a subhierarchy for r.r.a.digital.misc and r.r.a.digital.tcp-ip. It was pointed out that these were requested by users of r.r.a.packet due to the explosion of new digital modes. There has been no opposition from the r.r.a.packet community.
* Most people supporting the split have not indicated which option (I or II) they support. It was noted that it's been difficult to determine which will be the most-likely-to-succeed choice to put on the CFV.
* Those who prefer Option I seem to do so because the newsgroup names are clearer and more focused. It was said that r.r.a.tech is too general to differentiate itself significantly from r.r.a.misc. So the advantage is that Option I avoids some confusion. (Option I adds 7 newsgroups)
* Those who prefer Option II (r.r.a.tech) seem to do so because it has fewer newsgroups than Option I while still offering an area for technical discussion away from r.r.a.misc. So the advantage is that Option II is not as large an increase in newsgroups. (Option II adds 5 newsgroups)
* A preference was stated to change r.r.a.products to r.r.a.equipment. Rebuttals said that would be confusing next to r.r.a.construction. The suggestion did not have enough support to be added to the proposal.
* A preference was stated to change r.r.a.construction to r.r.a.homebrewing. Rebuttals said that the name would not be clear enough to outsiders or newcomers. The suggestion did not have enough support to be added to the proposal.
* A preference was stated to change r.r.a.operating to r.r.a.dx. Rebuttals said this would eliminate coverage for many other aspects of operating a radio. (Notably, UHF/VHF repeaters.) Also, this was considered on the rra-reorg mail list prior to the RFD, where DX and repeaters were combined to make r.r.a.operating. Another suggestion was to add r.r.a.dx alongside r.r.a.operating. The suggestion does not appear to have enough support but some discussion may continue.
* A preference was stated to add an r.r.a.bulletins newsgroup. No replies were made to a subsequent poll on the subject so the suggestion is assumed to have insufficient support. One problem was noted that it mostly overlaps rec.radio.info which serves all of rec.radio, including rec.radio.amateur.*.
* A couple articles suggested adding an r.r.a.flame newsgroup. Most participants seem to have assumed that was said tongue-in-cheek. It has not been taken seriously.
* r.r.a.space appears to have significant support. It will probably be on the CFV (call for votes) whether Option I or II is selected as the final model. It was noted that this will mean that Option II will add 6 newsgroups instead of 5. (r.r.a.space was previously only on Option I.)
* A suggestion was made to add an RDF (radio direction finding) newsgroup to the proposal. The original suggestion was to call it r.r.a.jamming. Another article suggested a clearer name of r.r.a.rdf. An opposing opinion said there is not enough traffic to make a separate newsgroup for this topic. This subject is not done being discussed but does not yet have enough support in the discussion to add it to the proposal.

You are right -- it's entirely the cable TV company's responsibility to
keep unwanted signals out of the cable. The cable frequencies are the
same as frequencies allocated to other things outside the cable.

If the cable company is picking up unwanted signals, the cable company is
also _emitting_ unwanted signals (through the same holes), and thus is
in violation of FCC regulations.

please excuse the cross-posting, but I'm seeing this in all 3 r.r.a groups,
so in this case, it seems appropriate....my apologies if this isn't a valid
assumption (but then, the post actually only gets sent once either way, so
it's not as if it generates any extra net.traffic or anything).

it would seem that once again, there is a fido node somewhere that seems to
think that the rest of the world wants to see duplicate copies of every
single post. anyone know how to handle this?

for example, in rec.radio.amateur.policy (when I finally decided I wasn't
imagining things), I saw a post from greg@core.rose.hp.com (Greg Dolkas).
a few articles later, guess what....that exact same post is repeated.
however, this time the article claims to be from
Greg.Dolkas@f716.n109.z1.his.com (Greg Dolkas).

the last time I saw this was about a week ago in comp.os.linux, and it
was a fido node that wasn't configured right, or something like that.
the symptoms were identical, and just as could quickly become the case
here, it was no doubt costing a lot of $$$ for some folks (a high-volume
newsgroup is bad enough...but when someone decides to double that volume
with duplicate postings, that's *REALLY* bad).

anyone know how to proceed in getting these duplicates stopped?

I think the cable company has it backwards (as usual). The cable companies
were allowed use of frequencies currently allocated to other services
on the condition that they not cause harmful interference to those
services and that they accept any interference caused by legitimate
users of those services. If your friends signal is getting into the local
cable distribution network it indicates that the cable company is not
properly maintaining their system. It also means that their cable system
may be exceeding FCC limits on cable leakage. The FCC has been cracking
down on cable systems that have excessive leakage, esp. in the aviation
bands.

Jim:

I have received many cards from Europe with this type of ID. They are
all SWL cards. Evidently it is very common in Europe to be assigned an SWL
"License". They compete in listening contests and generally appreciate
your response that what they have logged was correct.

John:

As you stated, the letter of the law is exactly correct. But the original post was much more bothersome. If I understood it correctly, the cable company understands the law but is trying to use local, neighborhood, propoganda to force the ham station off that frequency.

Also, the original posting mentioned that the FCC had been contacted but did not say what happened.

The original poster asked for reponses via email rather than netnews. I, for one, would be very interested in reading the responses and also learning what the final disposition of the case is when it happens.

This is a thread that is ripe for a switch to rec.radio.amateur.policy. I hope to see more of it there.

I currently monitor packets with an AR2500 scanner and a Kantronics KAM All-Mode TNC. If your scanner has a speaker/headphone jack, you should be able to feed that audio signal right into to a TNC, (or PMP) provided your scanner covers packet frequencies.

X-Comment: GRAPES Internet Electronic Mailing List
Content-Type: text
Content-Length: 3682
Status: OR

GRAPES (A Georgia Organization of local Ham Radio packet groups) is selling
full kits of the Heatherington 56KB R.F. Modem for $250.

You will need a transverter with a 28 mHz I.F.
for the band of your choice, case, chassis, jacks, power supply and frequency
determining crystals.. the printed circuit boards, documentation,
State EPROM, support diskette and all other parts are supplied..

The modem puts out about 1 mw of drive with a 28 mHz I.F.
Any transverter used should switch as quickly as possible in the 5-15 ms range
to be effective.. we use the Microwave Modules MMt 432-28S units however
these are getting difficult to find unless you find a used on at a hamfest.
The last few we purchased new were also pretty expensive ($389 for the
430 mHz units). We believe that the 220 mHz units were quite a bit cheaper
but we never bought any of those new. On the hamfest market, we have been
paying from $125 to $185 for used, usually working units.

Sinclabs (division of Sinclair Research) in Canada is shipping
a 220 transverter which has good characteristics and an even better
price tag ($289). We have two of these units and they seem to work fine.
They also suggested that they may develop a 430 unit at a later date.

The Transverter must be linear as the modem has amplitude
variations as part of the conveyed modulation, which must be reproduced
by the transverter.. Usually any transverter capable of SSB operation is
suitable if it switches quickly enough..

We also sell a printed circuit board set,
that includes the State EPROM, docs and support diskette for $110..
Documentation sets are $20 (US) and we have a VHS or Beta
Video tape featuring Dale Heatherington explaining the Beta modem design
for $20 (US) (upon special request, not normally a "from stock item").

Documentation set orders are creditable toward
parts kits or boards sets. Board sets are creditable toward full kits.

We are selling these to support our non-profit network building
activities.

If you wish to have an information flyer that goes into more detail,
please send your U.S. Mail address.

We pay U.S. shipping. We require that the approximate difference between
domestic ground delivery and premium shipping be sent in advance
(such as overseas 2nd day air which can cost up to $60).
The kits weigh about 2.5 pounds. I can put 3-4 kits in a shipping box
thereby saving .5 pounds per kit by saving the weight of the box and packing.
Please send orders (Order forms are not required,
just send a letter) and your check payable in U.S. funds to:

GRAPES Inc.
P.O. Box 871
Alpharetta, Ga 30239-0871

Personal note about E-mail (from KD4NC, not from GRAPES)
If you send questions (or order inquiries) via USENET mail remember that
I am not responsible for USENET mail reliability.. If you don't get a reply,
please try again, perhaps with a different mail gateway.. Just because
you don't get a bounce message, that doesn't mean that I received your
message.. This is particularly true of Overseas E-mail with where
E-mail paths are often one-way.. Please don't post bad stuff about
my lack of response to misc.radio.packet or any group, this job
is thankless enough as it is.... I appreciate your patience.
I don't like to post responses or Ads to misc.radio.* because
I know that in many location, this is gateway'd out over
packet radio. Also, misc.radio is not for commercial postings..
So I post a pointer to my E-mail address periodically and stop at that.

GRAPES is a volunteer non-profit organization (A regional Packet Radio Club).
No one here makes any money off of this.. it's all volunteer labor.

Thanks
73's

>city blocks from his transmitter). Supposably, the FCC has already been
>contacted, however, he hasn't seen or heard from any FCC officals
>yet.

i would be surprised if the FCC didn't laugh in the face of the CATV people.

We're not using their frequencies - THEY'RE USING OURS! He should go to 1.5 Kw output 8)...but seriously, it's the CATV folks that have the problem here.

possible actions include running around town taking measurements of leaks and showing the cable company where their problems are (copies to FCC field folks), setting up your own news releases to pre-empt any hostile CATV press: something like "CATV signals intefere with safety communications" especially if there are leaks in the aircraft band and there's an airport nearby. but you got to make an effort to get ahead of the negative press or else you'll be tarred and feathered before you can even say anything.

maybe you can find out what the CATV schedule is for system certification. they have to pass a system leakage check annually. the local CATV folks here have vans equipped with scanners and yagis and the servicemen are supposed to report back the locations where they find one of the marker signals above some threshold to give the maintenance crew some idea of where to start working.

"CATV interferes with Shuttle Communications Experiment" (well...the SAREX uplink is around 145 MHz.....)

maybe it's also time to check in with the other 2-way radio users to see if they have problems with cable intereference on their frequencies?

I'd have to go along with the above.... the first list (wasn't it
something like 50 subgroups? <grin>) is a bit much.... we do need
a split, but the 2nd list seemed much better to me. IMHO, of course.

key reasons why I'd like to see a split:

   1) better organization of ideas/topics (I don't buy the argument that
      everything will end up being cross-posted to every group...unless
      people intentionally do that just to prove their point that it
      would happen. it might happen some, but not to the extent that
      people fear.)

   2) let's face it, not everyone is interested in every topic that's
      discussed. I'm interested more in topics like [any technical
      topic, especially digital modes and antenna design], anything
      else relating to packet, AMTOR, PacTOR, etc., satellite stuff

> (still trying...on a zero budget, no less), bulletins, and so
> on, but frankly don't give a rat's *ss about code vs no-code, cw

> sites have limited disk space, too. I'd probably get most (and maybe
> all, depending on the signal/noise ratio of each) of the groups, but
> the topics I'm less interested in would be expired much, much faster
> than the rest.

many people will say that if you have a threaded news reader, it doesn't make any difference. well, this is true if you don't care about the costs associated with getting the articles, and if you don't have to worry about the space to store them. but having trn doesn't do much for either of these issues (feel free to prove me wrong by explaining how I can use trn, or C News, to set different expire times for articles within the same group based on the subject, but not necessarily the subject line, of the article, as well as not receiving them in my feed).

>I do NOT believe we need/want a separate flame group.

sure we do. it'd be the place to put all of the code vs no-code flame wars (e.g., the recent Real NoCodes bull), etc..... we could all just not subscribe to it. :-) seriously, that kind of crap is the main reason why I might one day drop rec.radio.amateur.misc, and just keep the .packet, and .info (and maybe .policy) subgroups (I don't have rra.info right now...but I'd get it if I nuked rra.misc).

type at y'all later.....

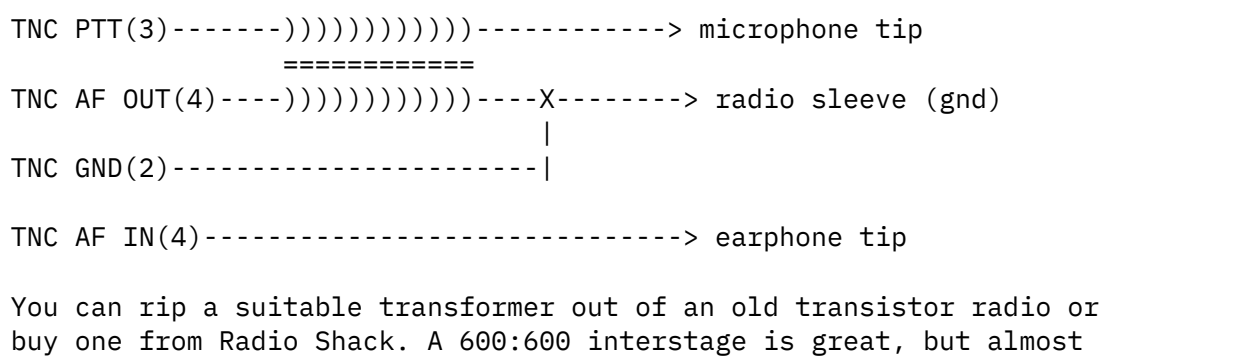
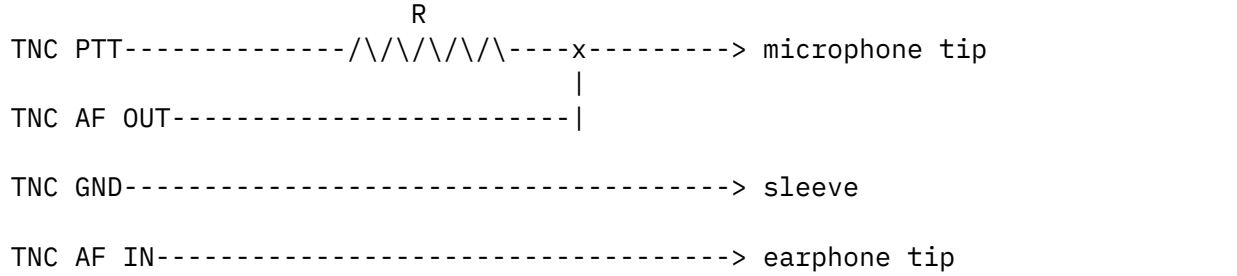
>   dan@crs.com

Ok, let's take a deep breath and start again. This isn't rocket science.
The first thing to do is put the TNC back the way it came from the factory.
You should need to make *no* changes to the TNC to work with a FT470.
Now you should measure near zero ohms (<100) from pin 3 of the DIN connector
to ground, pin 2, when the PTT light is on. This is a VMOS FET you're
measuring, and it has a zener across it to protect it. If you're using
a digital multimeter, you may need to use the diode test range to get
a reading because your meter may not put out enough voltage in ordinary
ohms range. Observe polarity. Since the PTT LED is working, we know the
PTT signal is getting to the gate of the FET.



Don't be fooled by the DIN connector. The pin order is not sequential.
It looks like this:

As a last resort, try a 1k resistor, an LED, and a 9 volt battery for
the test. The LED should light during PTT if you have the polarity right.
If all tests fail, and you can't get a near short indication when PTT
is on, your VN10KM switching FET is bad. Radio Shack carries them, or



you can send the TNC back for warranty repair.

Now assuming you *do* get proper switching action at pin 3 of the DIN,
you're ready to build the interface to the FT470. There are basically
two ways to do this. Here's the way I like to do it:

You can rip a suitable transformer out of an old transistor radio or
buy one from Radio Shack. A 600:600 interstage is great, but almost
any audio transformer can be made to work. I usually heatshrink the
tiny transformer into the cable assembly. This circuit will work with
Icom and Yaesu HTs.

Here's another way to do it:

For Icom radios, use 10k for R, for Yaesu radios, use 2.2k for R.
It's not necessary to put a capacitor in series with TNC AF out
since there is one already present inside the TNC.

Now all you have to do is adjust the audio level pot in the TNC to
give you 3 kHz deviation and you're ready to play packet.

Gary

Hi,

I don't have 73's release about Poor's man packet TNC. Could someone
send me plans, diagrams to build the modem.
I search others plans, diagrams about simples modems to be connected with
a Macintosh with SoftKiss.
I need informations about the maximum rate of TX with softkiss.

If possible, send plans in GIF, Pict or TIFF. (Binhexed if possible).

Many thanks.

Pascal Beaujeant.

CAPRA - the Chicago Area Packet Radio Association has arranged to
obtain a supply of Ian Wade, G3NRW's new TCP/IP primer -
"NOSintro." Reviews of this book have been quite good.

This 356 page book is a hands-on tutorial with documentation
regarding TCP/IP and NOS software version of this international
standard as implemented for use with amateur packet radio
operations.

An earlier posting listed all of the 35 chapters of the book
which outline the basics and more advanced topics of TCP/IP;
there are 6 Appendices with additional reference materials and
information. The book has over 80 detailed diagrams with
"countless examples of commands and screen displays".

The books will be shipped via U.S. Postal Service's 2nd Day

Priority Mail service upon receipt here in suburban Chicago.

Ian Wade, the author, has given us a discount for our quantity purchase. The cost to you will be slightly under the total cost which you would have were ordering directly from the publisher in the U.K.

This is NOT a money making undertaking on the part of our group. Many of us are active on TCP/IP and feel that this is a way to increase the awareness of and technical expertise of others who may be interested in or who are currently using the protocol in amateur radio circles.

Send your complete mailing address, a telephone number at which you can be reached should there be a problem, and a check/money order made out to CAPRA in the amount of $22.50. Canadian hams should send $24.00 in the form of a Canada POST International Money Order payable in U.S. dollars.

CAPRA - (Chicago Area Packet Radio Association)
Presents: TCP/IP - Seminar/Workshop

The interest in TCP/IP (Transmission Control Protocol/Internet Protocol) in the radio amateur community has been increasing rapidly in the past year or two. Unlike regular AX.25 packet, TCP/IP is somewhat complex to set up and operate. More than with any new mode,

there seem to be many people frustrated in their attempts to get started. As an aid to those interested in TCP/IP, CAPRA will conduct a hands-on, seminar and workshop.

TCP/IP is used extensively in telecommunications networking in government, educational, and corporate organizations. It includes several capabilities including unattended electronic mail exchange, retrieval/forwarding of files of information, software, and other materials to/from several hundred thousand computer systems throughout the world, incorporating hundreds of gigabytes (billions!) - pieces of information of all kinds, and, connectivity which allows authorized users to "operate" computer systems at distant points.

As implemented in the amateur community today, there are gateways to/from the amateur packet networks to the Internet (world-wide computer system networks), as well as to far distant amateur packet radio networks throughout North America, Europe, Australia and other points. Some, but not all of the capabilities of the amateur networks can be used with the AX.25 protocol; however, TCP/IP is "richer" and has greater capabilities to allow one to "reach out" to other amateurs and varied resources through the world as indicated above.

The seminar/workshop will:
- introduce you to the "basics" of TCP/IP
- introduce the amateur radio packet software package -- NOS
- explain the hardware requirements for using TCP/IP
- provide demonstrations via "hands-on" stations for your use at the workshop
- allow you to "prepare" a personalized copy of NOS for installation at your own station QTH
- discuss the backbone network in Metropolitan Chicago including links into the Internet
- answer questions, questions, questions...

When: Saturday, May 15, 1993
8:00 AM - Doors Open
8:30 AM - First Session
12 Noon - Presentation Conclusion
12 Noon - 1:00 PM - Lunch
1:00 PM until ??? - Discussion, Hands On, Prepare NOS Disks, Questions

Where: Harper Community College in Palatine, Illinois
(NW Suburban Chicago)(Algonquin and Roselle Roads)
Building H. Free Parking in Lot C.

Other:

- A brief written tutorial on TCP/IP is being prepared; if you are not familiar with the topic, you are urged to obtain a copy for review prior to the seminar/workshop. Please send $2.00 to the CAPRA Post Office Box prior to May 1, 1993.

- If you plan on preparing a personalize copy of NOS for your station,

bring the appropriate MS-DOS or MAC diskettes (minimum 3, just in
case)

Contact: Contact: Jim Chesner, N9GBH (708) 253-0046 n9gbh@kb9dip.il or
Bob Van Valzah, KE9YQ (708) 690-2282 bob@ke9yq.ampr.org if you have
questions.

CAPRA
Post Office Box 8251
Rolling Meadows, Illinois 60008-8251

NOTE: R.S.V.P.

Those wishing "hands on" assistance with equipment must reply; first
come - first served.

Subject: HAM-server INFO file
Message-ID: <gate.BZPF2B1w165w@grafex.Cupertino.CA.US>
Date: Sat, 03 Apr 93 09:26:46 PST
Lines: 89

All you might ever want to know about the KA6ETB HAM-server

Hardware:
========

386/25 PC clone
Telebit QBlazer modem
10-Meg file space reserverd for archive

Software:
========

Waffle 1.65
WFSmail 2.03

General Information:
===================

Orders for files are filled between the hours of 0100-0600 daily. This is so those hosts through which the traffic is forwarded are not overloaded. Since we all depend on the generosity of others to carry the mail, it behooves us not to make them angry.

ASCII (text) files are split at about 30,000 bytes or 700 lines (which ever comes first). UUENCODED binary files are split at about 750 lines.

If you are using a PC and you do not have UUDECODE, follow these steps:

1. Order UUDECODE.BAS or UUDECODE.C, and UUEXE515.ZIP.
2. Compile UUDECODE.BAS or UUDECODE.C on your system.
3. Use the resulting executable to UUDECODE UUEXE515.ZIP. UUEXE515 has documentation about UUENCODE/UUDECODE.

You are all set to start ordering binary files from HAM-server.

/hamradio/newfiles/ contains files that have not yet been categorized.

If you order a file and do not get it, check the index to be sure you have spelled the file name correctly. If you have ordered the file correctly, then order a new INDEX, as I may have moved the file to a different directory. The system is still expanding, and I am trying to keep it in managable chunks.

A new INDEX is automatically generated every Sunday.

New files are being added and old files are being changed and updated. You might want to send a order for NEWFILES <date> from time to time, to see what's new. <date> has the form of MM-DD-YY and is required.

Ordering Information:
==========

Send an email to:

    HAM-server@GRAFex.Cupertino.CA.US

In the text of the message, place:

    HELP
    INDEX
    GET /hamradio/00-INDEX.TXT

HELP will send you the HAM-server HELP file. This is processed immediately for return delivery.

INDEX will send you an index of the files and the directory they are in. 00-INDEX.TXT is a description of most of the files in INDEX. This file is in a continual state of flux, therefore many of the file names listed therein may not match INDEX, but you can figure it out.

Some Reasons Why Ordered Files Are Not Received:
==========

1. Your return path is incorrect. My bounce mailbox fills up quite regularly with messages. And, since the path is incorrect, I cannot contact you to let you know.

2. You have spelled the file name incorrectly. Use the file names listed in the INDEX, rather than 00-INDEX.TXT. The later is only a guide.

3. The file name has changed since the INDEX was generated. Order a new INDEX.

4. Your order was sent to KA6ETB@GRAFex.Cupertino.CA.US, instead of HAM-server@GRAFex.Cupertino.CA.US. File requests sent to me will not be honored (naturally).

I am posting this for a friend who doesn't have Internet access. Please respond to me if you know of the site where I could ftp this file for him. Thank you...Art, N0OQS

The program is called Kamterm. The archived file for the version I already have (v1.0) is KMTRM100.zip. My guess would be that the archive for the newer version would be called KMTRM120.zip, if whoever is putting the archive together follows the same format, at least! The program is a Host Mode terminal program for the Kantronics tnc's.

Good morning. It's Sunday the 4th of April and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- 18MHz-band intruders have been removed by RSGB; there are two new RSGB committee chairmen; and we have urgent news for Top band ARDF enthusiasts.

The RSGB's Monitoring System, otherwise known as the Intruder Watch, has had four recent successes which have been of benefit to all radio amateurs. An Argentinian fax, naval data and two diplomatic stations have been removed from the 18MHz band with the assistance of the Radiocommunications Agency. Brief details of the role of the Monitoring System can be found on page 78 of the RSGB Call Book and a fuller description is in the December 1992 edition of Radio Communication. The Coordinator of this RSGB service is David Owen, G0OES.

The RSGB Microwave Committee has a new chairman. He is Steve Davies, G4KNZ. The previous Chairman, Mike Dixon, G3PFR, become the Microwave Manager. The RSGB Planning Advisory Committee also has a new chairman. He is Geoff Bond, G4GJB. Details of the Society's other office-holders can be found in the April edition of RadCom.

The RSGB'93 Show takes place on Sunday the 16th of May at the National Exhibition Centre, near Birmingham. There will be the usual trade stands in a single huge hall, plus a large display of the work of RSGB Headquarters and of the Society's committees. The National Vintage Communications Fair is also being held that day in the NEC complex. Many visitors will wish to visit both shows and reduced rates are available for this.

Next details of two ARDF event which, unfortunately have not appeared in Radio Communication. The Top Band Amateur Radio Direction Finding contest for the Geoff Peck Memorial Trophy take place today Sunday the 4th at Cowleaze Wood, Stokenchurch, at NGR 727 958. Competitors need Map 165, Aylesbury and Leighton Buzzard. Competitors should assemble at 13.00 for a 13.20 start. The next Top Band ARDF is the Slade Qualifying Event which is scheduled for Sunday the 18th of April. The venue is the Industrial Estate, 2 kilometres East of Bridgenorth at NGR 739 927 found on Map 138, Kidderminster and Wyre Forest. Competitors should assemble at 13.00, to start at 13.20. Competitors requiring tea should notify John Drakeley on 021 772 2278 (work) or 021 770 3474 (home), no later than Sunday the 11th of April.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO.
From Ghana, the Dutch DAGOE Team will use the callsign 9G1AA from now until

Saturday the 10th of April. Check these frequencies: for CW 1832, 3505, 7005,

10105, 14020, 18075, 21020, 24900, 28020kHz and for SSB 1840, 3645, 3775, 3795, 7045, 7080, 14195, 18125, 21295, 24940, 28395kHz, RTTY 14090, 21090, 28090kHz From Liberia, F6FYD holds the call sign EL2YD and will be intermittently on the air until the end of 1993. From Liechtenstein, HB9BCK will be active as HB0/HB9BCK from Sunday the 11th until Saturday the 17th of April. From Kampuchea, F1MXQ will be active as XU5SE from now until mid-June. From Paraguay, the Radio Club Paraguayo will use the callsign ZP3AA to activate the rare ZP3 call area from Thursday the 8th to Saturday the 10th of April. Activity will be on all bands using CW and SSB. From the Maldives, DL1ZBE will be active from Ziyaraifushi Island from Sunday the 11th, until the 2nd of May on the 20, 15 and 10 metres bands, running barefoot to a ground plane antenna. DL9WVM will be active from Baros Island from Wednesday the 7th to Wednesday the 21st. The callsigns are not known at the time of going to press. From Aaland Island, a group of OH3 operators will be active from now until Monday the 12th of April. OH0LQK will be active on 10 metres SSB and slow CW on all bands, except the WARC bands. OH0NLP will be active on all bands using CW and SSB. OH0MEP will be active on all bands using CW and SSB, and especially the WARC bands, plus 20 metre RTTY. OH0MFP will be active on 10 metres SSB and 15 metres RTTY. Finally OH0MYD will be active on 10, 15, 40 and 80 metres using CW only. OH0/OH3NE may be aired on 6 metres.

Rally news now, and we know of two events for today, Sunday the 4th.

The Launceston Amateur Radio Rally is being held at the Launceston College in Cornwall. Doors open at 10.30am. There are the usual traders, a large bring & buy stall in two large halls. Hot snacks and refreshments are available and talk-in is on channel S22.

The White Rose Amateur Radio Society Radio Rally is being held at the Allerton High School, Kings Lane, Leeds 17. Doors open at 11.00am. 10.15am for disabled visitors. There are the usual trade stands, an RSGB stand and a bring & buy stall. Refreshments are available.

We know of no scheduled event for the Easter Weekend, Friday the 9th to Monday the 12th.

Contest news next:

The first of the RSGB Slow CW Cumulative Contests is tomorrow, Monday the 5th, from 1830 to 2000GMT, using 3.530 to 3.580MHz only. See March RadCom, page 81 for the rules which emphasise the importance of sending slowly during the event. The RSGB's first 1296/2320MHz Fixed Contest will take place on Sunday the 11th of April from 1600 to 2200GMT. See February's RadCom page 66 for the rules.

Special event Station GB2RN, operated by the Royal Naval Amateur Radio Society will be aired during Easter week. Activity starts on Saturday the 10th of April, and runs through to Sunday the 18th. Station is operated from the Bridge Wireless Office on HMS Belfast, located in the Upper Pool of London, between London and Tower Bridge. Check these frequencies: 1.970, 3.660, 3.740, 7.090, 14.190, 21.360 and 29.933MHz, CW and SSB as appropriate. Operation will also be on 2 metres FM and SSB. The local Packet Bulletin board will be GB7HSN, accessed on 2 metres.

Time to get your diaries out as we have news of the eighth AMSAT-UK Annual Colloquium which will be held from the 29th of July to the 1st of August at the usual venue, the University of Surrey. Anyone wishing to present a paper should submit an abstract no later than the 1st of May to: Doug Loughmiller G0SYX, Colloquium Programme Chairman, Centre for Satellite Engineering Research, University of Surrey, Guildford GU2 5XH. Booking forms for visitors to the Colloquium will be available from the 15th May. Requests for forms and any enquiries should go to: Ron Broadbent, Hon Sec AMSAT-UK, London E12 5EQ, enclosing a large self-addressed, stamped envelope.

And now the solar factual data

For the period 22nd to 28th March, magnetic storms seriously affected northern latitudes but were declining by the end of the period. Only one flare of any note was reported, an M2.3/SF on the 23rd. Otherwise only small B and C flares were reported. Sunspot counts have meaned about the 67s and solar flux levels have averaged 121 units hardly changing day to day. The geomagnetic Ap index was up to full storm levels of 47 units on the 24th, about K7, due to a mag storm starting at 21.55 hours on the 23rd, and though levels declined it remained unsettled up to the end of the period. The Ap average for the period was 23.2 units. The state has been mag storm at northern latitudes and 'Strat warm in final stage'. The radio quality indices have declined with the magnetic storm and were down to very poor on the 24th. The Stavanger circuits were almost useless, with Moscow and New York being only slightly better. Due to a mistake the aa indices were sent out for the wrong period, so are not to hand this week. The X-ray flux has been very low and averaged only B2.3, though the 24th was down to only B1.9. Levels were recovering as this bulletin was being prepared. Bartells rotation started on the second of April.

Now the ionospheric data for Central France:

Not all the data is to hand but the F2 daytime critical frequencies at Poitiers, as reported by Meudon, have declined considerably and averaged only about 8.4MHz. On the 24th it was only 6.1MHz due to the magnetic storm. The darkness hour lows were not affected so much, being about 3.0MHz. There has been periods of spread-F most days.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg have declined. The daily highs averaged 8.2MHz and the darkness hour lows 3.2MHz. Solar cycle 22 is still giving us surprises, after month 77 it is recording the second highest mean level of solar flux, surpassed only by the highest cycle ever recorded, cycle 19. It is also higher than the mean level of all passed cycles at this time since solar flux has been measured.

And lastly the solar forecast:

This week, the most active side of the sun will be rotating away. Solar flux levels are expected to be about the 150s. Geomagnetic activity is expected to be unsettled due to the passage of coronal holes, and on the basis of history the radio quality indices are expected to be normal. MUFs are expected to

reach 30MHz during the day on north/south circuits. Darkness hours are expected to reach about 18MHz. And that's the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 T J and G7 O T series, and Novice calls in the 2 0 A E and 2 1 B P series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Hi

I have recently built myself a Baycom modem, I had no trouble building the thing - but I cannot get it to work !

It will not key up my transmitter (an FT470) nor will it receive any data. I am fairly certain that the TCM3105 chip is decoding data OK as I can see the voltage change on the RXDATA pin of the TCM3105 with a multimeter. I am beginning to think that the signal levels it generates are not good enough for my PC to recognise as RS232 levels.

The PTT line on the RS232 port (RTS I think) is toggled when I attempt to TX but the FT470 does nothing. (The sam can be said for the two other rigs I have tried !).

One strange thing, when I plugged the modem straight into the back of my PC, into a 9 pin male socket, it keyed the TX for about 20 seconds and then stopped, but then refused to key it again. This may point to a cable problem ? The cable I was trying to use to connect the PC to the modem was a 25 pin female to a 9 pin male connector. Maybe someone can furnish me with the correct connections for this, allow I think it is just a normal RS232 cable that is required.

I hope someone can give me a clue as to what the problem is, or some
test to try as I have tried everything I can think of.
--

I have some RCA TAC-200 VHF mobile rigs for sale which are perfect for
packet operation, repeater construction or other non-frequency-agile use.
You have to change several capacitors on the exciter board and 4 on the receiver
board to bring them down to 2 meters (they were 150-165 MHz) but I've put
together a kit of all the capacitors you'll need and complete instructions,
with pictorials, on how to effect these modificatons. Control cables, control
head, microphone and schematics are included (I don't have speakers for
them, but any 4-8 ohm will do fine). One transmit and one receive channel
element will be included. You can get crystals for about $11 each for these.
Channel elements can usually be found at swap meets, etc. or they can be
purchased from Bomar or other crystal companies. I've reverse engineered
a receive channel kit (without the nice socket to plug it in or the cover)
that I can supply for $7.50 each (no crystal) while supplies last.
I still haven't identified a couple of parts on the transmitter channel
element but I hope to be able to supply them for $10.00 each in the near
future. Physically, the trunk mount unit is about 12"x24"x4". Total weight
is 35 pounds packed for UPS shipment. Some units may have bent or broken
cooling fins on the trunk unit, but I've tested all of them at the 163.065
MHz frequency and can guarantee they work. I want $70 each, plus shipping
($15 will send one UPS most anywhere in the contiguous USA). I use a
12 volt 10 amp battery charger with a large (54,000 mfd, 40 volt!) capacitor
with a total cost of less than $30 which works fine as a power supply.

Here is the schematic of another Baycom-style modem. It is based on the
AMD AM7911 chip (also AM7910 will work) and is capable of both 1200 baud
and 300 baud packet.

Unlike other designs, this one is NOT TINY. Since I do not plan to stick
it in a backpack and operate packet radio from the mountains, this makes no
difference to me. It will fit on a circuit board that is on the order of
10x10 cm and requires external power.

On the plus side, it is robust and noise-tolerant (far more so than the
Baypac modem that I had previously) and is fully RS-232C compatible - it
should work with all COM ports.

First some disclaimers: I like it - you may not.
I have never tried the 300 baud setting. It may not work correctly (if
anyone tries it, I would appreciate hearing the results).
I never found a good analytical way to adjust VR1 (MIC level) without a
service monitor. It is probably not crucial for most radios that
automatically adjust mic level.

Construction notes are on the schematic.

Schematic is in PostScript format. Cut at the lines (before and after) and
send the file to a postscript printer.

Please let me know your experiences with this design.

>is a big enough topic, _then_ it deserves the same level as the other
>topics, i.e. make it r.r.a.tcp-ip and r.r.a.digital (or digi-misc if
>you must).

Well, if you propose to put them at the same level, then you have
r.r.a.tcp-ip and r.r.a.packet. I feel that there is going to be some
confusion on which to post to since tcp-ip is another packet mode.

There was an interest in including other digital modes, AMTOR, PACTOR,
RTTY (Ughh) into a separate group. Thus the proposal of r.r.a.digital
to replace r.r.a.packet. However, water and oil describe how the
AX.25 and the TCP/IP community get along, and I am sure that the
AMTOR enthusiasts will not be met with open arms into the former
.packet group (my guess, not MY opinion). I *might* suggest that
it be better to split it into three sub groups:

```
     rec.radio.amateur.digital.misc   < include all other modes >
     rec.radio.amateur.digital.tcp-ip
     rec.radio.amateur.digital.ax25   < replace .packet >
```

but I feel kind of silly suggesting that since it is r.r.a.misc that is
overloaded, not r.r.a.packet (yet)

If you want my opinion, I like Ian's proposal since it allows the
tcp-ip'ers to get out of the closet, and volume be-damned (I think there
is going to be enough volume non-the-less) and clearly suggests that
`modes digital' are discussed and allows for furthur expansion in the
digital groups. Up one heirarchy, parallel to .digital/.packet and it
starts loosing it's meaning (tcp-ip IS .packet, and IS .digital).

Subject: Can BayCom save Monitor Window data?
Date: 5 Apr 1993 20:18:12 GMT
Organization: HP Colorado Springs Division
Lines: 22
Message-ID: <1pq464INN5j3@hp-col.col.hp.com>
NNTP-Posting-Host: hplsdaw.col.hp.com

I have a home built BayCom modem/TNC and am using ver 1.5
software. There was a balloon lauch in Denver yesterday,
and I was able monitor to the data from the balloon. However,

I could not get the software to save the data from the
monitor window to a file.

If I connect to a station, I can save all data sent from
the station to a file using the Write command. But
the balloon team did not want anybody connecting to the
balloon packet, so I could not use this method.

There are Mcall and Mselect commands, but I couldn't
seem to get these to work the way I thought they should.
I assumed I could monitor only packets from the balloon,
but instead, I got nothing (on the screen, or in a file).

Has anybody with a BayCom modem been able to monitor
packets from a station, and store that info to a file?

Does anyone out there know if there is an FTPable copy (ies) of
the radix 95 encoding and decoding utilities somewhere in netland?
I have tried archie, but no luck. Please reply by e-mail to the address
below. Thanks, es 73's

There are a lot of messages in this group about doing packet "on the
cheap" but what about at the other end of the spectrum? If the goal is
to get mobile (say, 60MPH on the freeway) IP connectivity or X Windows
support (a la X Remote, etc.), what's the best I can do these days?
One suggestion has been to use a CellBlazer and run PPP, which
obviously doesn't use packet. What's the high end in packet these
days?

Thanks,

/jordan

Another beta test version of the AA4RE BBS system is now available.
For users with GOPHER, you can find it now in the Amateur Radio
section of index.almaden.ibm.com. For those wanting to use FTP, I
have sent the files to ucsd.edu and they will be available in the
hamradio/packet/aa4re directory as soon as Brian transfers them there.

The files are compressed using PKZIP V1.1

BB21FC ZIP -- Doc, common utilities, etc

BB21FN ZIP -- "Real mode" DOS programs
BB21FP ZIP -- "Protected mode" DOS programs. Requires 286
              or better machine with minimum 2MB storage
BB21FL ZIP -- Library for BB21FP.ZIP (same as previous versions)

If you are using MBBIOS, you will also need version 3.8

Enjoy,

Roy, AA4RE

: That's right. And as far as I know the CB regulations in Europe come from the
: CEPT.

That is correct. The CEPT regulations for CB, which are enforced over most
of Europe, says that you will have to use FM and a maximum power of 4 watts.
The use of AM, SSB and other modes are subject to national regulations
(in Norway, only for equipment bought before, say 1985, and with a max.
power output of 0.5 W)

I just read an article in a magazine from Silicon Valley
California that says GE is mass producing a portable
laptop or notebook system with a built in packet system
which connects to an already existing national relay
system (I forget the name).
I wonder if this is perhaps restricted to the larger
cities for operation.
Anyway the article goes on to say that one way, that is
reception only packet built into to light weight
notebook computers will be the next wave to come out
soon, so that one can have complete Compuserve, etc.
wherever without phone hookups, etc.
This may be old news for this group, but it looks like
the big companies may be grabbing this packet stuff
after all.

I did a search on Archie for R95 and r95 and came up with several sites
with the Radix 95 software.

I just got my Tech. license, and would like to buy a CHEAP 2meter rig. I
use our school's radio club station now, but thats a bit inconvenient,
so I would like something of my own. Nothing fancy. Note, the key word
here is _CHEAP_ (as in desperatley poor college student cheap:). So if
you have something lying around that you hardley use anymore, please
drop me a line, and we'll work out a deal.

Thanks in advance.

With permission of N0ARY, I pass along the following for your perusal:

Date: Mon, 15 Mar 93 23:53:27 PST
From: bob (Robert Arasmith)
To: users%allcan@bbs.Arasmith.COM

Enough talk, time to get started. We are undertaking what I envision as the next generation of BBS. It offloads a lot of the user interface and work to the users pc as opposed to the BBS itself. This is often described as the client/server approach.

A short example will show you what I mean...

You are running the client code on your pc. When you log into the bbs you are recognized as being a bbs client as opposed to a standard user. The bbs would then send the output of the LIST NEW command in a compressed binary form. The software on your pc will decode this info and display the listing to you in a scrolling window.

You could then scroll through with your mouse or arrow keys and tag messages you wish to read. As you tag them your pc will make a request of the bbs for that message. The message would be again transferred in a compressed form. By the time you have tagged all the messages you wish to read you will already have a few of them back from the BBS. You can read them while the remainder are fetched from the BBS.

As for sending a replying to messages. The software on your pc will take care of most of the work. Allowing you do use screen editing to correct mistakes, import files, etc. When you have it just right your pc would ship it compressed to the bbs. All subsequent list requests would be handled in a similar fashion.

So what do we gain? First, things run much smoother and faster from the users point of view. The listing of messages will be occurring locally. You'll be able to scan forward and back through the list tagging what you want to read. The client will be issuing read requests in background. Things will seem to occur almost instantly from the users point of view.

Channel usage will benefit. Rather than sending formatted text to the user, the BBS will be shipping binary structures. Taking far less space. Not only that but the need to issue re-reads and re-lists will be a thing of the past. Once you have gotten a listing or read a message it is on your machine. A re-read is handled totally on your computer.

This is just the most obvious example. Since the BBS will be communicating to a program on your end all transfers can be short. No longer will the bbs be leading you through commands at 1200 baud. Most of this will be handled locally, at the client.

Want to get involved? Well the N0ARY bbs will be capable of this mode of operation in a matter of weeks. We have two hams lined up already to lay down some code. For the mac, Jim Van Peursem (KE0PH) the author of Savant a mac packet program, and for the pc under dos we have Gary Mitchell (WB6YRU). If you have a desire to join us in this endeavor please send me a message. We need a windows expert and someone for the other computers commonly found connected to tncs. Send me a message and I will send you the binary specification.

The bbs is also available if you want to setup a bbs/server in your
area. Send me a message and I will send you some information on
what the bbs has to offer besides what is discussed here.

Dear OM,

I have an Alinco DJ-120 VHF (144-146 MHz) tranceiver and I use it
mainly for packet radio. The main problem is that I cannot disable
the battery saver function, so I often lose packets. Does anyone
out there know how to disable this function?

I would like also to use it with a transverter for 430-440 MHz
and I have been told that it can be modified to cover 140-150 MHz.
Does anyone know how to do it?

Please reply by e-mail, as I have no regular access to
the Net-news, to the following address:

kkrallis@leon.nrcps.ariadne-t.gr

Thanks and 73

SB NETWORK@NCR
Statistics on BBS hops

Statistics on BBS hops from a sample of messages at VE3KYT

by Gerard Piette VE3GF
CP 694 Embrun Ont
K0A 1W0

Packet radio bulletin board stations (bbs) are inter-networked together and exchange, under program control, messages between themselves, often to a specific location, at other time to all unvisited locations to achieve the widest distribution in the target area, says ALLCAN or ALLUSA or ALLONT.

Each message contains a portion reserved to show the path that a particular message took to get here. The distance between any two bbs stations is highly variable, depending on the medium the message took. Large distances between any two bbs can be achieved via satellite stations, HF stations, while short distances can occur between a local VHF bbs and a UHF gateway station.

For the remainder of this discussion, we are not interested in the actual distance a message has travelled, but how many times a computer had to relay the message. Normally the greater the number of hops relates to the greatest distances and widest distribution of the message. It is assumed that no BBS alters the routing tables other than appending their own name to it.

A computer analysis of 1284 bulletin-type messages of interest read by the author from the VE3KYT bbs over three months, produced the following table showing the frequency distribution of the number of forwarding bbs stations the messages had to go through before reaching Ottawa versus how many such messages were relayed that many times as well as some percentages. Some interesting statistics can be gathered from this sample

# of relaying BBS stations	# of msg	% of total with histogram	cumulative percentage	(100% - cumulative %)
1 hops	5 msgs	0.4% |*	0.4%	99.6%
2 hops	13 msgs	1.0% |**	1.4%	98.6%
3 hops	20 msgs	1.6% |***	3.0%	97.0%
4 hops	111 msgs	8.6% |******************	11.6%	88.4%
5 hops	102 msgs	7.9% |*****************	19.5%	80.5%
6 hops	147 msgs	11.4% |************************	31.0%	69.0%
7 hops	63 msgs	4.9% |**********	35.9%	64.1%
8 hops	48 msgs	3.7% |*******	39.6%	60.4%
9 hops	54 msgs	4.2% |********	43.8%	56.2%
10 hops	139 msgs	10.8% |**********************	54.7%	45.3%
11 hops	120 msgs	9.3% |******************	64.0%	36.0%
12 hops	80 msgs	6.2% |************	70.2%	29.8%
13 hops	33 msgs	2.6% |*****	72.8%	27.2%
14 hops	40 msgs	3.1% |******	75.9%	24.1%
15 hops	27 msgs	2.1% |****	78.0%	22.0%
16 hops	24 msgs	1.9% |****	79.9%	20.1%
17 hops	23 msgs	1.8% |***	81.7%	18.3%
18 hops	22 msgs	1.7% |***	83.4%	16.6%
19 hops	22 msgs	1.7% |***	85.1%	14.9%
20 hops	26 msgs	2.0% |****	87.1%	12.9%
21 hops	24 msgs	1.9% |****	89.0%	11.0%
22 hops	15 msgs	1.2% |**	90.2%	9.8%
23 hops	15 msgs	1.2% |**	91.4%	8.6%
24 hops	12 msgs	0.9% |**	92.3%	7.7%
25 hops	14 msgs	1.1% |**	93.4%	6.6%
26 hops	12 msgs	0.9% |**	94.3%	5.7%
27 hops	11 msgs	0.9% |**	95.2%	4.8%
28 hops	4 msgs	0.3% |	95.5%	4.5%
29 hops	6 msgs	0.5% |*	96.0%	4.0%
30 hops	5 msgs	0.4% |*	96.3%	3.7%
31 hops	5 msgs	0.4% |*	96.7%	3.3%
32 hops	5 msgs	0.4% |*	97.1%	2.9%
33 hops	7 msgs	0.5% |*	97.7%	2.3%
34 hops	4 msgs	0.3% |	98.0%	2.0%
35 hops	3 msgs	0.2% |	98.2%	1.8%
36 hops	2 msgs	0.2% |	98.4%	1.6%
38 hops	3 msgs	0.2% |	98.6%	1.4%
39 hops	1 msgs	0.1% |	98.7%	1.3%
40 hops	5 msgs	0.4% |*	99.1%	0.9%
41 hops	3 msgs	0.2% |	99.3%	0.7%
43 hops	3 msgs	0.2% |	99.5%	0.5%
45 hops	1 msgs	0.1% |	99.6%	0.4%
46 hops	2 msgs	0.2% |	99.8%	0.2%
50 hops	1 msgs	0.1% |	99.8%	0.2%
54 hops	1 msgs	0.1% |	99.9%	0.1%
59 hops	1 msgs	0.1% |	100.0%	0.0%

From the above, one notices that few messages (2%) are generated locally (less than three hops).

Three quarter of the messages went between 4 and 12 bbs relays
before getting to Ottawa.

There must be a concentration of authors for these messages some
4,5,6 and 10,11,12 bbs away.

At a distance of 7,8 and 9 hops away from Ottawa, the packet radio
population is somewhat thinner than closer or further away,
although these stations still produce some 12.5 % of all
messages.

A suprising 10 % of all bulletin messages read originated from
stations 23 or more bbs distant from Ottawa. Most of those were from
either Europe or South America.

The furthest message was relayed by 59 different BBS stations before
being read here!

The path information extracted from the messages in question is
available in the D(os) area of the VE3KYT bbs. Useful packet radio
maps can be drawn from this information.

Anyone having done similar analysis of bulletin traffic should
contact the author to discuss results obtained elsewhere.

Next time you post a message addressed for wide distribution, think
a bit on how many times each of the characters of your message will
be repeated on the air, add up the airtime for all packets related
to these characters, multiply that by the number of hops your
messages takes to propagate, further add the number of packets
required to transport it's contents to each person reading the
message from their home bbs and let's see who come out with the
highest airtime usage!

Any wild guesses can be addressed to Gerard, ve3gf@ve3kyt. 73.

Recently I posted (mistakenly to rec.amateur.misc!) a plea for help with
connecting a Macintosh LCII, Kantronics KPC-3 TNC and Alinco DJ580 HT
together. I figured it out before any responses showed up. In case
anyone else is trying to do this here's what I found.

The radio side:
The radio hookup was done using the manual's example for the ICOM 2AT
radio but the resistor value was too small. I added another 1K to the
3.9K shown in the diagram; it works fine. Next I'm going to try a
4.7K for less bulk than two series resistors.

The computer side:
I use hardware flow control with my telephone modem but the modem cable
wouldn't work with the KPC-3. (Now I need to review the modem
configuration to see just what signals it's using.)

Although the KPC-3 manual talks about hardware flow control it doesn't
make it clear that the factory default requires RTS/CTS flow control.
At least I think this is the case.

My solution:
On a female DB-25 connector I tied pins 4&5 and 6&20 together
and did the same on a male connector. Then I connected pins 2,3 and 7
straight across between the connectors. Probably the TNC end only
needs 4&5 and 6&20 tied together but this is no science experiment;
I just wanted it to work! In fact probably only 4&5 need to be connected.

Next project: TCP/IP & KISS...

Well we're still poking along at 56 kb on 222 or 440 MHz. I don't
know anyone actually running packet in the car with one of these
systems. However, Dale used them with a codec to do mobile digital
voice experiments. It worked really well. Multipath is less of a
problem, at least for voice, than we had expected. I know a couple
of fellows who run 1200 baud packet from their cars, but typing and
driving really don't mix. They use them mostly as Email boxes, so
speed isn't critical.

``Kamterm [sic] 1.20 FTP site?''

I think I can help with that one, seeing as how I wrote KAMterm.... :-)
just about all the details you ever wanted on getting KAMterm follow.

In article <1993Apr5.035518.9666@mercury.cair.du.edu>

awinterb@diana.cair.du.edu (Art Winterbauer) writes:

>I am posting this for a friend who doesn't have Internet access. Please
>respond to me if you know of the site where I could ftp this file for him.
>Thank you...Art, N0OQS

(an e-mail copy is on its way right after this one....I'm posting too, in
case there are other people looking for this info.)

>The program is called Kamterm. The archived file for the version I already
>have (v1.0) is KMTRM100.zip.

KAMterm version 1.00 is very, very, *VERY* ancient. there have been rather
a lot of improvements (mostly new features, but also some bug fixes) since
version 1.00 was released. really, if you're still looking at version 1.00,
it's time to be hitting some ftp sites ASAP...you'll find it's well worth
the time/effort.

unfortunately, the upload announcements from SIMTEL20 go to
rec.radio.amateur.misc instead of .packet, since they're actually posted
to an e-mail digest, and eventually work their way into the Usenet
heirarchy.

>My guess would be that the archive for the newer version would be called
>KMTRM120.zip, if whoever is putting the archive together follows the same
>format, at least! The program is a Host Mode terminal program for the
>Kantronics tnc's.

yes, I am, and you're right...the new version is indeed called
kmtrm120.zip. it would add way too much confusion to change the rules in
the middle of the game, and as long as we're sticking with 8 char
filenames (+ .zip extension), kmtrm___.zip works nicely.

ok, for the info on where to snarf up a copy..... the following is from
the newsletter that's about to be sent out (just a bit late...I've been
swamped these last couple of weeks) describing the new version. the
actual text I'm quoting from isn't on a partition that I can access from
here (I had a disk crash recently, and I haven't had time to re-build the
dos emulator yet), so I'm typing it in again, and trying to hurry so I can
get this out in time for tonight's UUCP feed....so there may be a few typos.
my apologies in advance.

 --------------------------- CUT HERE ---------------------------

At this time, the best place to get KAMterm is either direct from me or
from the MSDOS archives at wsmr-simtel20.army.mil, which I will keep
updated. KAMterm is also available on the N4HMD BBS here in Ft. Walton.
Full Membership is automatically granted to licensed hams (usually within
24 hours of first call). The BBS's phone number is [904]-651-9309. He
also has a high-speed modem (V.32/V.42/V.42bis) on [904]-651-8684. The
filename on N4HMD's BBS is KMTRM120.ZIP. On SIMTEL20, the filename is
PD1:<MSDOS.PACKET>KMTRM120.ZIP.

You can also get a copy directly from me if you wish. For now, you need
to either call me and arrange a modem transfer or mail me a disk (in a
disk mailer) and return postage.
 --------------------------- CUT HERE ---------------------------

(btw, I can only handle 5.25" 360k disks and 3.5" 1.44 Meg disks here.)

KAMterm is, of course, also to be found on SIMTEL20's many mirror sites
and e-mail servers. the 2 main mirror sites I know about are
wuarchive.wustl.edu (I think it's ./mirrors/msdos/packet/kmtrm120.zip) and
oak.oakland.edu (not sure, but it might be ./msdos/packet/kmtrm120.zip).
for e-mail, you can send to listserv@vm1.nodak.edu, with the following
text in the body of your message (except not indented):
      /pdget PD1:<MSDOS.PACKET>KMTRM120.ZIP
and *NO SIGNATURE*.

btw, if you need to contact me directly for a copy, I'm at 904-243-6747.

hope this helps. e-mail me anytime if you have questions, problems,
things you'd like to see added, etc.....

Ian Kluft, in <efB803hDceof00@amdahl.uts.amdahl.com>, states that there
is support for the proposed reorganization of rec.radio.amateur, then
presents a tally whose numbers show that a majority of those participating
in the discussion did not favor the proposal. This is invidious.

I do not support any reorganization of rec.radio.amateur at this time.
Proposals made to date offer movement without meaningful progress. The
substantive underlying problem is one of aggregate news volume, and while
there are effective solutions to that, they are untenable.

Has anyone had luck in using a PK-88 with "other" firmware? I am trying to
use either the WA8DED firmware or the "THE NET" firmware to run on the
PK-88. The main problem I see is that the PK-88 uses software selectable
baud rates which the WA8DED or "THE NET" don't support. On TAPR 2 TNC's
the baud rate is selectable by the switches on the back of the unit.
If you have any sugestions please reply to me..Thanks... ES

>EPROM work? Thanks.

We have a bit regenerator being used on a 9600 Baud repeater. It is
simply an 8 bit FIFO chip (as supplied on the TAPR G3RUH Modem). I
experimented with using a TNC2 at 9600 Baud to form a bit regenerator, and
was surprised that there was just not enough speed to do it (to actually
get rid of bit jitter better than just an audio repeater, 1200 should work).
A waste of a Z-80 anyways, since the FIFO chip talks directly to the modem,
you don't need the extra processing cruft.

There is *no* reference to bit regeneration in TheNet X1G documentation!

`Anyone knows ?

There is a company in Florida called PacComm that makes what is called
a HandiPacket TNC which includes standard TNC2 commands, a Personal
Message System electronic mailbox, and has KISS capabilities. It runs
on batteries and has a good life there upon.

Also if you are interested, I have the roms for the old HK-21 heath
pocket packet on file from when Tasco picked up the line and expanded
the PROMs to have KISS mode included. No documentation with it, and you
have to do a software reset, else a hard reset from within.

I would be interested to know if you have any good places to get a
Heath HK-21 fixed. (or a new one cheap) In the process of my testing and
playing with mine, I broke the bus connections. When trying to fix that,
I fried it somehow....

When you take out the undecided or unclear (unclear == one-liners not
expressing any opinion) comments, it's 2-to-1 in favor of the split.
If you're counting the undecided posts, I had to include them only so no
one would say I was omitting anything. They obviously cannot be counted as
for or against.

In case your interested in DSP's Here is an article that
I worte, that appeared in the January 92 issue of QEX

A NEW DSP FOR PACKET

In the early 70's synthesized radios became available to the Amateur
market. However, the technology wasn't new. The Military used
synthesized radios since the early 60's. The computer and micro-
processor became popular in the mid 70's and that got us into the
packet age in the 80's. But we all know that electronic computers
where around for about 25 years. In the 90's, it appears that
the hottest item is the DSP.   Again the technology has been around
for about twenty years and it's finally making it's way into the
Ham Radio market. As with any new technology the reason for it's
availablity is cost reduction due to large scale integration.

Manufactures of Ham gear are including DSP's in their products and

there is a little skepticism about the price! Is it really worth the three or four hundred more dollars just to clean up a few harmonics in my signal? How can it improve packet reception on HF? Will I have sell my old gear ? After being involved in a DSP development project I beleive that the DSP can make a significant improvement in HF packet and RTTY reception and it's well worth the investment.

For the about the past 7 years the DSP has been reduced to a single chip about the size of the microprocessor in your computer. In fact, the DSP is nothing more than a microprocessor. A very special processor that can handle mathematical computations at lightening speeds. The DSP that I'm involved with runs on a 40 mHz clock and Texas Instruments now has a version that runs at 50 mHz.

Like any new technology the price is always high at first. But when newer chips are developed, the old ones drop in price. That's true with the TexasInstruments TMS320C25 DSP. When it was first introduced about two years ago, it cost about $125.00. Now you can get them for about $25.00 in single quantities. That's why we choose the TI DSP for our project.

THE DSP25 BLOCK DIAGRAM/ DESCRIPTION

The DSP25 is an inexpensive Digital Signal Processor that plugs into the 8 bit expansion port of an IBM PC or IBM compatible computer. It provides audio connections to a receiver or transceiver for operating digital modes in the HF or VHF bands. It also has an 8 bit TTL input/output port for interfacing to a Packet or all mode TNC. There is also a 16 bit I/O port on a 32 pin header connector to interface to a baby board which can contain a dual parallel DAC for connecting an X/Y tuning scope or other ancillary devices.

The DSP can replace the TNC's analog filters, fsk demodulator or tone encoder. It can also be used as a digital audio filter for CW mode, a digital signal analyzer and a digital oscilloscope within the audio range. FSK signals are processed and converted to a TTL level to the 8 bit I/O port or they can be converted to an RS232 level and transferred to the audio out port. The FSK signal can also be regenerated (eliminating 100% of the noise) and interfaced to a TNC's audio input (A to A connection).

The audio to audio connection simplifies the "hook up" and still provides the advantage of improved error performance. The DSP25 consist of four basic circuits, the PC Host interface, a Texas Instruments 40 mHz TMS320C25 Digital Signal Processor chip, 8k words of RAM, and a Texas Instruments TLC32044C Analog Interface chip. It's constructed on an IBM PC/XT compatible 10" expansion PC board and the analog/digital connections

are accessible on the rear bracket/panel.

THE HOST INTERFACE

The PC Host interface decodes the PC address, passes data from the 8 bit PC bus via the buffers and latches to the 16 bit DSP bus. It provides handshaking between the PC and DSP, and by placing the DSP chip in hold mode, DMA (direct memory access) from the 8k RAM to the PC I/O port is possible. There is also a sequential address decoder which allows the PC to access the ram in two 4k word pages for loading binary files from a floppy or hard drive and for providing direct memory access for large data transfers.

THE ANALOG INTERFACE

The Analog Interface chip converts the audio or linear signal to digital data. It transmits the data on a receive serial communications port to the DSP chip. The DSP processes the data and returns it to the A/I chip via the transmit serial port. The A/I can be programmed for pass through mode and there are 3 gain steps available. The DSP pcb has filter chokes to reduce EMI interference to the receiver and a quad op-amp is used to boost the signal in either direction on the analog port.

SOFTWARE

The software for the DSP is still under development but we do have two working modems that are di-no-mite! The PKT modems are for packet and test results so far are very promising. We decided to work on the 300 baud modem first because the problems on H.F is causing the packeteers the most trouble. We have ran test using 45 baud RTTY and the PKT modem was very promising but the filters need to be retuned for the lower baud rate.

Here's a brief description

PKT SERIES MODEMS

The PKT series modem is computer software that is designed to operate on the PC compatible DSP25 Digital Signal Processor for 300 baud Packet Radio and ASCII modes. They where computer simulated and tested to obtain maximum noise rejection and the best possible error rate performance for Amateur and SWL applications.

Except for the analog interface and IO port, the block diagram on the next page is hypothetical and does not reflect an actual working circuit or electronic diagram. The modem filters and functional blocks are embedded in the software. Several functions can be changed or modified using the "Control Panel" software that is provided with each modem.

The Analog Input

The audio signal from an H.F. receiver/transceiver enters the analog interface chip and is converted to data. The data is sent to the DS Processor and it performs the mathematical functions (indicated by the blocks).

Pre-filtering

The first function is a sixth order Chebyshev bandpass filter. The filter reduces noise and improves the performance of the A.G.C. block. The data is then processed by the limiter which sets a maximum numeric limit. The data is then passed to the second sixth order filter which further reduces noise and pre-filters the signal for the frequency detection blocks.

FSK Decoding (The Frequency Detection Block)

Two fourth order Bowtie tone filters are separately tuned at the mark and space frequencies. The filters separate the energy in FSK signal. The signal or data is then rectified by generating positive numbers from the mark filter and negative numbers from space filter.

Post filtering

The numbers are further processed using a lowpass filter. It removes the high frequency components in the serial bit stream and further improves the signal to noise performance. Other mathematical routines include a threshold detector and hysteresis. The data is then passed as a serial bit stream to the I/O port or other functions. The modem also includes a carrier detect, an FSK oscillator and control logic which allows the user to setup various parameters using the Control Panel software.

OTHER PKTA/PKTB MODEM FUNCTIONS

Modem Parameters

The Carrier detect routine keys the FSK oscillator on and off as well as providing an output via the I/O port on DIN1. It also (bydefault) sets the AI chip in a loopback mode when no signal is detected. This allows the user to monitor the channel via an external speaker/ amplifier during quiet channel conditions. The channel can also be monitored via the first and second prefilter which reduces the audio bandwidth and noise. The first and second perfilters can be used as a CW filter.

Audio to Audio connection

A parameter can be set which allows the user select the FSK oscillator only. This function provides an interface from the DSP to an external TNC's audio input and it regenerates the received signal with noise a free FSK generator. The TNC decodes the FSK using the improved signal to noise performance of the DSP. During a quite channel (no packets) the FSK oscillator will be disabled, then the TNC can key the transmitter using the normal connection to the XMT key line for packet operation. If the monitor option was enabled and the regenerator disabled because no carrier was detected, the received channel can be monitored via the DSP using the full breakin capabilities of the software. The user can also use the audio oscillator to provide audio FSK to a transmitter,s "mike" input. Because of the XMTR's low input level, a resistor divider network is needed to drop the audio level to the XMT

Audio to Digital connection

The Audio input to the DSP connects to the receiver's speaker or aux audio output. It can handle levels as high as 1 volts p to p however, overdriving of the DSP can damage it or cause poor error performance. The typical level should be about .3 to .7 volts RMS.

The TNC's TTL level serial data input is connected to the DSP's DOUT0 output. The FSK is demodulated by the DSP and the serial bit stream is sent to DOUT0. The TNC decodes packets or RTTY using the improved signal to noise performance of the DSP. DOUT1 is the inverted serial output.

The TNC's TTL level serial data output is connected to the DSP's I/O port DIN0. During transmit, the data from the TNC is switched to the DSP's FSK oscillator. The DSP,s oscillator is connected to the transmitter's audio input using an attenuater network. This allows the user to implement the DSP's continuous phase, frequency shift oscillator .

DOUT 2 is a TTL level Carrier detect. It can be connected to a TNC to be used as an external carrier detect.

DOUT3 is a XMT key line and can be connected to some TNC's for keying the transmitter. This output is a TTL level output and requires a special circuit for transmitter keying.

TEST RESULTS

I conducted a test using two PK232's and an Icom R71 common receiver on 20 meters (the TNC's where in monitor mode). One PK232 was connected to the DSP card Via the external modem input on the rear

apron. A modem formerly called P3020 (now PKTB) was loaded into the DSP from an IBM PC. The other "barefoot" TNC was connected to a Compaq Deskpro and both computers copied the text to a capture buffer. The time/date on both TNC's where set within a few seconds. A Radio Shack counter module #277-302 was connected to the carrier detect L.E.D. circuit. The threshold was adjusted for average strength packets.

HERE ARE MY RESULTS

Test #1

Both TNC's didn't copy very many packets. The band condition at that time was poor.

Test #2;

The band condition improved and 182 packets where counted. The PK232 copied 47 and the DSP/PK232 copied 116.

Test #3

Only 3 packets where copied on the barefoot PK232, on the other hand, the DSP copied 82 out of 202.

Test #4

There where 78 packets out of 487 for the PK232 and the DSP/PK232 copied 162.

As you can see the DSP, depending on the band conditions, did a much better job. The DSP makes a better FSK decoder because the filters where designed and simulated for a specific application (packet radio). If the circuit in the PK232 was simulated on a DSP the two units probably would have performed the same.

COPYING CW

The upgraded version of the PKT modems have a feature that allows the user to monitor the receivers audio through the FSK decoder's pre-filters. I used this setup to copy CW and weak cariers on 20 meters. I was able to pull out signals that where almost in-audible (about equal with the noise level). The second prefilter was selected. The first prefilter responce was about equal to a 4 pole BP chebychev. When I tuned to a stronger signal, I tuned across the filters bandpass (about 400 hz) in noticed as I reach the lower or upper limit of the passband, the signal dissapeared as if the filter had infinate stopband response.

Conclusion

The DSP is a newcomer in the HF digital world. More software and better
modems that can handle the hostile HF environment are needed.
Because the DSP is versitle modems can be developed, simulated
and easly loaded. It will allow developers to try other modulation
schemes that can greatly enhance digital communications on H.F.

How do the PacComm "Baymod-9" or "Baymod-2" compare with this Tigertronics

BayPac BP-1 that looks about the size of a DB25 gendermender, and what's
the difference between the first 2?

The BayPac caught my eye because my laptop computer case has just enough
room for my ht, another battery, and probably it for a pretty portable
communications system.

Could someone email me the connections for hooking up a icom IC2WA
to the baycom packit modem.
I have no documentation on this unit.
I anyone has interfaced the baycom unit to the above set, I would appreciate
some help.
cheeres.

What's required to run one of these systems? 56kb would be fine for
the application I'm thinking of.

What exactly is the source for the 50kbaud modems? I have looked
some, but I haven't been able to find much info. What kind of
setup (i.e. modem, radio, TNC) is standard? What hardware would
you recommend?

You need a GRAPES 56 kb RF modem and a transverter. The modem is an
RF design using MSK that outputs on 29 MHz. You use a transverter
to kick that to the UHF band of choice. Occupied bandwidth at 56 kb
is 70 kHz. There are 100 kHz wide channels on 222 and 440 in the
bandplan for these modems. You'll also need a PAD of some sort.
GRAPES will give you modification instuctions and a firmware
image for the TNC2, or you can use an internal card in a PC.
The Ottawa group sells the PI card, and Gracilis sells their
Packettwin card. We recomend this method as the cleanest way to
go. As far as I know, everyone is using one of the KA9Q NOS
varients with these modems since drivers are available for
the cards. Note that the MAC serial port can drive the modem
directly, it's an 8530.

Email if you want more info on the GRAPES modem.

Gerad VE3GF shows us a very interesting distribution in messages going
by his BBS. The double hump in the distribution is probably because
of the distribution of local and wide area hierarchical routing
designators for his location.

Gary,

Could you please add an internet-formatted address to your .signature file?
Something in the form of xxxxx@xxxx.xxx. Your "From:" line in your messages also
is listed only as gary@ke4zv.uucp which will not work with most mailers. My guess
is that kd4nc!ke4zv!gary@gatech.edu or something like that would be appropriate.

In your message on 56KB you say "send direct email if interested" and I'd like
to... I would like more info on the 56KB stuff you are doing, though I probably
would run it on AX.25 since I am not too hot on such slow speed use of TCP/IP,
nor am I too thrilled with the NOS software (primitive at best).

73,

Dan N1JEB

Are you seeing that the modem is triggering the PTT on your radio?
Have you gotten a hold of another radio to use to listen to your
packets to see if the modulation sounds ok?
How far from your station are the other stations? What type of antenna
are you running? What power are you transmitting at? etc.?

While enforcement *is* lax, that doesn't change the fact that it is
illegal. CB is a garbage band primarily because people don't follow
the rules. In most social activities, this rule following is by
consensus of the majority with only a few outlaws that require police
action. This allows for a stable and friendly group interaction. On the
CB band, the outlaws are the majority. Only fascist application of
police power can suppress a majority, and that hasn't happened yet.

Gary

Hi

I am having trouble finding a circuit diagram and a parts
list for the poor mans packet (PMP). Does anyone know where I can
find this?

Thanks in advance

Regarding the Baycom schematic that I posted earlier, some errors have been
pointed out to me.

The schematic says: Sheet 1 of 2 but there is no second schematic page (and
nothing is missing). I guess that the parts list counts as page 2.

The schematic has R2 listed twice and no R3.
If the real R2 is next to D2 and the real R3 is next to D3, then the value
of R3 listed in the parts list should be 100k and not 2.2k.

Also, I tried the audio muting circuit that is an add on in the schematic
"for FT470 to silence" and it didn't work well. The design without this
works just fine with my FT470 so I didn't worry about it.

As I said before, I don't like this design that uses TTL levels to drive
RS232 lines so I changed it. Therefore, I can make no guarantees about how

it works. The design that I used, which was modified from this, works wonderfully!

This is a good way to get into packet and I have found that it is all that I need.

Can anybody tell me if the converse service available under newer versions of NOS has been ported to 4.3BSD as a standalone program, and if so where I can pick up the source code for it.

Many thanks,

  Some modems do not mute the txdata line during receive. I use either a shunt
  transistor or a series fet switch (cmos quad bilateral works fine) to keep
  the PLL from being wobbled about while the radio is trying to receive.

There are two sites that carry TheNet code:

ucsd.edu
tomcat.gsfc.nasa.gov

The latest TheNet Plus is 2.10st and TheNet X1H is listed. TheNet X series contains an IP Router and also requires a 27C512 EPROM. Bank switch instructions are in the ZIP file.

    There are so many chat programs for unix it would be so easy to do.
    You can even write your own in shell which has been done already
    its not that hard. I bet you can make a shell program look just
    like the nos converse node will a little effort.

    It can be done trust me :-).

I heard something about a mod for the AEA PK-232 for 170Hz shift. I presume
this is to optimize the receive filters for 170Hz rather than for 103 modem.
Can somebody point me to the article telling about this?

Another excuse for them to confiscate equipment, that is all :-) I asked
the local Department of Communications about this (Canada) and they told me
that packet radio would allow one to communicate furthur than 25 miles.
Also, to tap the TNC into the microphone line (even if it was only at the
connector) would void the type-acceptance of the rig. The only type accepted
modulation source is the mike that came with the rig, or any type accepted
replacement mike. The only modulation method approved for CB is AM and
SSB. A TNC tied to the mic `could' technically be called FSK when feeding
SSB, even though it is AFSK (regular audio modulation). This is also
where I got this statement that it contradicts an ITU agreement on use of
11M band. I have since seen that some countries ignore this agreement ...

I have since seen type accepted TNCs though too ...

>as anything other than another one of the many noise makers that have been in
>vogue on 27 Mhz for a number of years??

You mean lin-ears, pow-er mikes and lids? :-)

>I would think the FCC would be pleased to see someone other than hookers and
>small-time drug dealers actually making some serious use of the band.

:-) Packet is `serious use' of the 11M? Jam away!

Hi Dave,

(Maybe it is about time for my cheap packet posting again.)

---> Please see my Poor Man's Packet references below.

I also offer to email anybody any combination of the following files:

```
  faq_ham      = rec.radio.amateur.misc FAQ
  faq_packet   = rec.radio.amateur.packet FAQ
  packet.tut   = A "packet tutorial"
  new_packet   = packet newcomers info
```

Email me if you think I can help.

Ted Cline, N0RQV
ted_cline@hpisla.lvld.hp.com

Summary of Inexpensive 2m Packet Systems:
---

1. For PC-compatibles:

   A. Poor Man's Packet: (the authors are on internet)
      I. Page 8 August 1991 73 magazine.
      II. Anonymous FTP: helios.tn.cornell.edu (128.84.241.2),
      /pub/PMP/pmp11dsk.zip (includes executables, source,
      article text, errata, interface hints, etc.).

   B. BayCom revision 1.50a software and either BAYPAC or use the
      TCM3105.ZIP Postscript schematic:
      I. Review: December 1991 issue of 73.
      II. Anonymous FTP: WSMR-SIMTEL20.ARMY.MIL (192.88.110.20) or
      mirror sites like OAK.Oakland.Edu (141.210.10.117)
      wuarchive.wustl.edu (128.252.135.4)
      ftp.uu.net (137.39.1.9)
      nic.funet.fi (128.214.6.100)
      src.doc.ic.ac.uk (146.169.3.7)
      archie.au (139.130.4.6).

      I have used wuarchive.wustl.edu (128.252.135.4):
      /mirrors/msdos/packet/tcm3105.zip and
      /mirrors/msdos/packet/baycom15.zip
      (=BayCom revision 1.50)

The later revision 1.50a is available from ucsd.edu :
/hamradio/packet/baycom/baycom15.zip (168789 bytes)
and also an ENGLISH manual for rev 1.2:
/hamradio/packet/baycom/manual.zip (42424 bytes)

Note: Some older versions of the tcm3105.zip schematic
have 2 R2s. I think the "R2" connected to the
CTS line should be corrected to R3, a 2.2K ohm.

2. For Macintosh:
PacketMac Modem:
Page 8 October 1992 73, and errata page 54 November 1992 73.
(the author's listed internet email (Francis4@apple.com) did
not work, 2-24-93)

3. Commodore 64: I was told:
> Digicom 64 in the August 1986 73 (date ??).
>
> The software is public domain and is usually bundled with a
> "kit," PCB, hard-to-find parts, etc.; from some hams that
> translated the original documentation from the German.
>
> A more-or-less accurate list of the guys that can supply the kit
> is listed in the ARRL publication, "Gateway to Packet Radio."

Notes:
---

1. I have only used Poor Man's Packet, but hope to try BayCom soon.

2. If you have Internet mail but not FTP, try the FTP mail server:
send a mail message with the subject "help" and a single message
line "help" to ftpmail@decwrl.dec.com.

3. I have uploaded the "AX.25 Amateur Packet-Radio Link-Layer
Protocol, Version 2.0 October 1984" specification as ax25.doc in
/hamradio/packet/ on ucsd.edu . If you have problems getting the
file, I'll be pleased to email it to you.

4. You may require an 8-bit editor to modify the the Poor Man's
Packet source code, I suggest Microsoft's m editor (came with my C
compiler), or Microsoft Windows 3.1's Notepad editor.

5. I have seen these ads:

BayPac BP-1, "$49.95 + shipping" (73, Jan 1993, p54):

I have received the latest copies of the WB9LOZ packet series (direct from
the author), and have placed them on-line.

They are available thru my file server. For information, send email to:

HAM-server@grafex.Cupertino.CA.US

In the text of the message, place:

HELP
INDEX

I also have other files that I have yet to categorize. Currently there is
over 8-MB of amateur radio related information on-line.

REQUEST FOR DISCUSSION
REORGANIZATION OF REC.RADIO.AMATEUR

This request for discussion is the beginning of the newsgroup creation process
outlined in GUIDELINES FOR NEWSGROUP CREATION, which can be found in
news.groups. Because of the high volume of traffic in rec.radio.amateur.misc,
a mail list was created (with an open invitation posted to the newsgroup) to
discuss the issue. This RFD is in response to two problems that were
identified by the mail list.

1) rec.radio.amateur.misc has a daily traffic volume which is too high for most
   people to follow on a regular basis.
2) rec.radio.amateur.packet needs to be renamed due to the growth of other
   digital modes besides packet on amateur radio.

30-DAY DISCUSSION PERIOD

The newsgroup creation guidelines require a 30-day discussion period.
All comments which are to be considered toward this discussion must take place
on the news.groups newsgroup. For that reason, this RFD contains the header
line "Followup-To: news.groups" so that replies will only go there.

This discussion period is not a voting period. If the discussion period
shows that there is sufficient support, the process will continue on to
a 21-31-day voting phase, which will be described in a Call for Votes (CFV)
article.

Modifications may be made to the proposal during the current discussion phase.
Once a CFV is posted, the proposal at that time may only be approved or
rejected. No modifications will be made during the vote.

Comments and discussion posted to rec.radio.amateur.misc and
rec.radio.amateur.packet cannot be considered official. However, users of
the Info-Hams and Packet-Radio mailing lists, which are linked to these
newsgroups, cannot access news.groups.   So discussion of how to handle the
mail lists may take place there on an unofficial basis. This unofficial
procedure is being acknowledged in the RFD because no alternative exists for
the mail list users. Users must remember 1) the process does not require
any action on articles posted outside news.groups and 2) final authority for
the mail lists lies with their administrators.

NEWSGROUP REORGANIZATION PROPOSAL

The scope of this RFD is the newsgroups within the rec.radio.amateur hierarchy.
Other newsgroups (even others under rec.radio) are not a subject of this RFD.
The CFV following this RFD, if a CFV is issued, will not propose any changes
outside of rec.radio.amateur.

The current newsgroups are as follows:

[all the following groups are unmoderated]

rec.radio.amateur.misc	Amateur radio practices, contests, events, etc.
rec.radio.amateur.packet	Discussion about packet radio setups
rec.radio.amateur.policy	Radio use & regulation policy

In determining a reorganization of rec.radio.amateur which frees some of the
traffic from the single newsgroup rec.radio.amateur.misc, the members of the
reorganization mail list considered the following guidelines which the
participants in this discussion are also asked to consider:

* More is not necessarily better. Several newsgroups were proposed and then dropped because the traffic levels on those subjects do not warrant their own newsgroup. (examples: video, repeaters, antennas)
* We were not trying to use new newsgroups as a place to discard unwanted subjects. With as large an audience as rec.radio.amateur has, everyone would want to discard some subjects somewhere so WE DID NOT CONSIDER THAT A VALID REASON TO CREATE A NEWSGROUP. There is no rec.radio.amateur.cw in this proposal because the productive areas of that subject fit better within r.r.a.operating and r.r.a.instruction. Most of the heated arguments about morse code requirements will still belong in r.r.a.policy under this proposal. All newsgroups in this proposal were justified by sustained traffic volume in that topic. A borderline case (emergency services) was decided in its favor because it is part of the purpose of amateur radio, as much as experimentation is.

The proposed reorganization of rec.radio.amateur would result in the following groups: [all the following proposed groups are unmoderated]

```
Newsgroup name                   description
--------------                   -------------------------------
rec.radio.amateur.misc           all Ham radio topics not covered below
                         i.e. video, stories, humor, new topics
                         [no modification to existing newsgroup]
rec.radio.amateur.policy         regulations & policy issues
                         [no modification to existing newsgroup]
rec.radio.amateur.digital.misc       packet radio & other digital modes
                         [includes old rec.radio.amateur.packet]
rec.radio.amateur.digital.tcp-ip TCP/IP via packet radio
rec.radio.amateur.operating      Operating procedures and questions: DX,
                         CW, contests, propagation, repeaters
rec.radio.amateur.products       manufactured equipment, modifications
rec.radio.amateur.instruction        Ham radio instruction & examination
rec.radio.amateur.construction       homebrewing & experimentation
rec.radio.amateur.space          amateur radio in space: satellites,
                         earth-moon-earth (EME), shuttle, MIR
rec.radio.amateur.emerg-services emergency services: RACES, ARES, NTS
```

Under this proposal, rec.radio.amateur.packet will become an alias for rec.radio.amateur.digital.misc, which is intended to replace it.

An alternate proposal, aimed at having fewer newsgroups, found some support in the reorganization mail list. It is presented here as a potential alternative for use in the discussion, as a guage of which one the rec.radio.amateur community prefers. It amends the proposal as follows:

```
Newsgroup name                   description
--------------                   -------------------------------
rec.radio.amateur.tech           Technical discussions about Ham Radio:
                         construction, satellites, theory,
                         examinations, video, repeaters
                         [unmoderated]
```

[this replaces r.r.a.instruction, r.r.a.construction, and r.r.a.space, plus taking all technical topics from r.r.a.misc]

REFERENCES

If any users wish to see a transcript of the discussion on the reorganization mail list which led up to this RFD, it is available for anonymous FTP at charon.amdahl.com (129.212.11.1) in /pub/radio/amateur/rra-reorg.log.1.Z (160K+ after decompression.)

The mail list was created after a public invitation to join that was posted with worldwide distribution. The following people chose to participate:

   ehare@arrl.org (Ed Hare KA1CV)

My office mates and I are preparing to put in a packet/internet
gateway in our office. We have an ethernet connection in the office
and would like to gateway this to packet (probably on 2m).

I have a few questions that are un answered at this point, but mostly
what I would like is to correspond via e-mail to someone who has done
this.

My current thoughts are to use the KA9Q NOS as the gateway running

on a spare 286 PC that we have. I understand that NOS can talk
to a KISS mode TNC as well as to ethernet, but may require Clarkson
drivers for the ethernet. Do these drivers come with NOS? If not
can I FTP them from somewhere?

Anyone care to elmer me through this project?

Thanks!

The following article was actually the first one I posted on the 18th. The
second didn't go out until several days later - without going to the moderated
newsgroup news.announce.newgroups.

This should clear up the complaints we had about the other posting not being
cross-posted to news.announce.newgroups. And a lesson for me... when a
blizzard hits the East Coast while the moderator is moving house, just be
patient - it can take a few extra days.

Anyway, this makes the OFFICIAL 30-day discussion period start today, 3/26.
Though I see no reason why any discussion already posted to news.groups would
be omitted from consideration. Continue with the discussion - there's no doubt
the RFD is official now. Official discussion will continue through April 25.

As always, the first step (in the USA) in trying to locate a company is to call
1-800-555-1212 and ask. You'd have found that 1-800-DIGI-KEY is their
number.

>

I have a friend who has one of these units, and the filters are as
WIDE as a barn door!! There is no way that changing the filters by
30 Hz will do anything. Maybe its is the transmit tones that are corrected.
(They are set for 200 Hz) People (like me) who have decent mark and space

filters wont have to keep re-tunning !
I built a couple of 6-pole bessel bandpass filters for this chap, for
use with his pk-232 on HF AMTOR/RTTY, using Maxim 274s (each chip is
capable of an 8th order filter). To get the accuracy, you have to hand
measure all the resistors! Works great though, nice thin lines on the
cross display (not the footballs of the original filters) (or to be
technical an eyehight of about 98% rather than about 20%).

~~~~~~~~~~~~~~~~

The problem with running the C64 emulator and digicom is the fact that no cassette port exists! Kind of hard to run the digicom modem that way. You might be able to run baycom (the IBM version of digicom) with an IBM emulator, but the fact that it has a TSR and talks to the com port hardware might preclude that. If you have a TNC and want to run it (I'm not sure if this conversation is in regards to hardware/software solutions so apologies if I'm off topic) there is a packet terminal program for the amiga and NOS is also available.

Hello,

Are all hand-held transceiver able to connect to TNC ?

If not, how can I know one ?

I think they will do if they have sockets for both external microphone
and earphone.

Do I have to match the impetance ?

Thanks in advance.

Subject: Building-wide wireless communication (Q)
Message-ID: <1993Mar28.225837.12141@maths.tcd.ie>
Summary: Info sought on cost and feasibility
Keywords: wireless computer communication
Organization: Dept. of Maths, Trinity College, Dublin, Ireland.
Date: Sun, 28 Mar 1993 22:58:37 GMT
Lines: 29

We are interested in the possibility of using wireless communication
to link computers and terminals within a building
(max distance about 50 metres).
I suppose what we would ideally like
could be described as wireless ethernet.

I saw the recent articles in Byte on this,
but was disappointed that they did not seem
to deal with this area.

(1) What roughly is the cost per unit?

(2) Is there normally any licensing problem?
(I realise that this will depend on the country,
but would be interested in the general position.)

(3) Which part of the spectrum is normally used?

I'd be most grateful if anyone with information
or suggestions would send them to me,
or post them on the net.
I'm not quite sure if this is the correct newsgroup
for this question. Apologies if it is not.

I'm spending a week in Columbus Ohio, and I brought along a HT and a
TNC. Does anyone have a bandplan for 2m and 70cm packet bands in this
area (I am staying downtown, in a hotel, so radio
reception/transmission will be limited)

Thanks,
Paul

Lines: 32

Since I work for a company that packages UNIX for Intel-based systems,
I'm curious about the possibility of using a UNIX system for my packet
host. There'd be lots of advantages to it -- it could be doing a bbs
or whatever, and I could still do my income tax at the same time and
be accessing my computer at work. Multitasking -- wheee!

I haven't done anything with packet for quite a while. I don't know if
I need to apologize for this, but taking 15 minutes for a 3 sentence
QSO at 300 baud with somebody 4 hops away who types about 5wpm wasn't
my idea of a stimulating hobby. I'm glad somebody stuck with it, though,
to advance the state of the art.

So is it possible to use a commercial version of tcp/ip w/o software mod?
I see that we've got a class A addressing scheme, 44.xx.xx.xx. I've

heard the word 'PPP' mentioned. TNCs are just modems -- is it possible
to configure yourself with an IP address, connect a serial port to the
TNC, configure PPP, connect your TNC to an HT, and communicate?

Or does it require some special modification of the tcp/ip software?

thanks,

I have uploaded the "AX.25 Amateur Packet-Radio Link-Layer Protocol,
Version 2.0 October 1984" specification as ax25.doc in /hamradio/packet/
on ucsd.edu . If you have problems getting the file, I'll be pleased to

email it to you.

I also offer to email anybody any combination of the following files:

```
  faq_ham      = rec.radio.amateur.misc FAQ
  faq_packet   = rec.radio.amateur.packet FAQ
  packet.tut   = A "packet tutorial"
  new_packet   = packet newcomers info
```

Email me.

Hope this helps!

Unless they have seriously cleaned up their act, I would be VERY carefull of buying ANY memory products from Jameco. The 27C512 EPROMs killed my EPROM burner. It took awhile, several EPROMs and a couple trips back to the programmer vendor before we figured out the cause. I have also gotten bad and/or unprogramable 27C256 eproms from Jameco. From this track record, I would seriously think twice about ordering any memory or CMOS product from them.

I just purchased the Alinco DR599 2m/70cm FM set.

I intend to use it for Packet Radio. Now I like to know as much as possible about this set, so anyone who is using it please respond.

Specifically for packet, I would like to know the Microphone input levels for a good modulation.

Also, I would like to know what the remote-control microphone (standard on US models) sends to the set. (is it DTMF tones to pin 6 of the mic plug?). What features can be selected by the programming jumper resistors R30-R35 (not sure about the numbers; out of the top of my head...) at the back of the display module? How are they set on the US model?

I already found out the pinning of the Mic. connector (just by opening the microphone), to find out it hasn't audio output there. It has only separate VHF+UHF Audio output sockets on the back. There also seems no way of remote controlled selection of the band to transmit on. This would make dual band use of packet not easier.

I have found out quite a lot of extra features that are not documented in the preliminary user manual I got with my set. Is there anyone that has a better manual?

If anyone is interested in the extra features I found, I'll type it in and mail it, or post it if there is enough demand.

Any help appreciated.

73s,

Rob, PE1GOX in GM land.

>be accessing my computer at work. Multitasking -- wheee!

Some of us are using UNIX hosts for packet, but it's not completely
simple.

>I haven't done anything with packet for quite a while. I don't know if
>I need to apologize for this, but taking 15 minutes for a 3 sentence
>QSO at 300 baud with somebody 4 hops away who types about 5wpm wasn't
>my idea of a stimulating hobby. I'm glad somebody stuck with it, though,
>to advance the state of the art.

Isn't that the truth. Keyboard QSOs are a drag, but letting the machines
patiently transfer mail and files isn't so bad. High speed modems, like
the 56 kb GRAPES units, make even interactive use tolerable.

>So is it possible to use a commercial version of tcp/ip w/o software mod?

No. Here's the rub. First the commercial versions don't know about AX25,
and second, the timing parameters are way off from those needed for radio
networks. Since the native TCP/IP implementations can't handle the link
level dialogues of AX25, you have to write a device driver that can do
this. The timing parameters are often a harder nut since they're often
coded in. Unless you have source, which *you* may have, changing them to
a level that won't cause "packet storms" on the radio net is out of the
question.

>I see that we've got a class A addressing scheme, 44.xx.xx.xx. I've

>heard the word 'PPP' mentioned. TNCs are just modems -- is it possible
>to configure yourself with an IP address, connect a serial port to the
>TNC, configure PPP, connect your TNC to an HT, and communicate?

A TNC is *not* just a modem. It is also a PAD, a packet assembler
disassembler, and also an asynchronous to synchronous HDLC converter.
It *may* also implement the AX25 link level protocol through a host
mode interface that you must adapt your UNIX code to interact with,
or the simpler KISS handler. It's *possible* to use TCP/IP via the SLIP
or PPP protocols over an ordinary TNC running the traditional AX25
firmware, but link setup is not automatic and you'll need to write
scripts, similar to dialer scripts, to set up connections. Responding
to *incoming* connections is a nasty problem. The better approach is
to use the KISS firmware and move the AX25 link level code into the
device driver where your computer will have more intimate control. Even
better is to use a TCP/IP package where all this is integrated for
you, such as the KA9Q NOS package. Even this is not an optimal
solution because you don't intimately connect with your native
TCP/IP services, and KA9Q code doesn't give you the network
transparency you'd like on a multitasking machine.

The *best* practical solution is to install a DOS box running KA9Q
code as a *gateway* between your ethernet and the radio network.
Since this code understands radio and ethernet networks, and is
configurable as a router, it will allow you to use your native
TCP/IP on your UNIX machine to best advantage. It has source
quench capabilities to keep the packet storms off the radio and
it understands AX25. You won't be able to do link level only
AX25 connects from your UNIX host, so you'll be cut off from
the non-TCP/IP packet world, but the TCP/IP parts will work
correctly. You can move to the DOS box keyboard to do link
level only connections to BBS systems and keyboarders because
KA9Q code supports both types of sessions, and it can handle
multiple instances because it is itself a lightweight multitasker.
This is the method I use to get my UNIX box on the air.

Gary

There is an AX.25 driver available somewhere on the net (try ucsd.edu)
for Sun boxes. You link it into the kernel and it runs. My understanding
is that it talks straight to a KISS TNC, though I haven't played with it
myself.

>The *best* practical solution is to install a DOS box running KA9Q

This is what I do too. By changing ~ dozen lines in sendmail.cf, I implemented
an e-mail gateway from my UNIX box to the AMPR net. Mail comes in on the modem,
and goes out the TNC via a TCP connection from sendmail. Very nice!

I also put a MUD (multi-user dungeon) program on the UNIX machine and the hams
connected and played together.

Dear Tim;

There are several types of systems available with the speed and connectivity that you are in need of, all of which operate in the 902-928 Mhz Spectrum Range. I am not aware of the available frequency spectrum that is available in your part of the world, but I can offer you a source for equipment that would act as a "Wireless" Ethernet bridge that typically has a range of 800-3000 feet indoors, and 5-20 miles line of sight outdoors.

All that is required is a bridge unit at each site connected to the existing Ethernet backbone, and an appropriate antenna aimed at the other unit.

Note that this is inherently limited by the facilities of "raw" AX.25.
Since there is no "portnumbering" facility in AX.25 analogous to TCP,
you can only have one connection per station pair in AX.25. Even if
your users don't really care about multiple sessions to the same host,
the ability to support them anyway is handy. It makes your system
inherently robust in the presence of half-open connections and long
network outages, without having to rely on keepalives ("makedeads") to
close down half-open connections. With TCP, you can easily tolerate
lots of half-open connections if you have to, as each one is just some
ram in a table (or better yet, just virtual memory pages on a disk).

This isn't completely true. There is a ax25 <-> tcp protocol
bridge available that converts incoming ax25 connections into
tcp connections and allows tcp only machines to initiate ax25
sessions. It's not in the standard NOS, but the source code
changes & some docs are available..

Examples in use here in Mpls include :-

A KA-Node clone running under Unix.
A PBBS mail interface running under Unix (written in Perl).

Ax.25 access to the callsign server running under Unix.
Ax.25 access to the tcp converse bridge.
etc etc

I've got a shar file lying around somewhere if folks are interested.

I have gotten around this by using the SSID as a "port" in my
experiments with AX.25 under 386BSD. When a process creates a listen
socket, it specifies in the AX_ADDR structure both the callsign and
SSID it will listen as, which allows you to (for example) have your
callbook command interpreter available for connection as KA9Q-14, your
BBS as KA9Q-2, and your discard server as K5ZC-1. If no process is
listening on a particular AX "port", connection attempts are ignored -
with the exception of the default port address.

Additionally, the system is given a default AX_ADDR per port which is
used when it makes AX.25 stream connections incidental to transporting
higher level protocols, such as IP and net/rom. If no process is
listening for stream (non-encapsulated) data on that address,
the connection will still be accepted, but stream data will be silently
discarded. I may change that to reply with a simple canned message.
Because of the extraordinarily short-sighted design of AX.25, there is
no good answer to this problem.

Once I get routing working to my satisfaction, or I get totally

disgusted with the whole project, I'll be making the code available.

More details on the ham-bsd@ucsd.edu list, but only if you're into unix
kernel hacking.

I am looking for pointers to makers of antennas suitable for 902-928 MHz
apread spectrum work. preferably ones targeted for the amateur market,
rather than the commercial market (cost IS an issue). I have some designs,
but I don't want to get into the business of making antennas.

please mail replies.

Let me put in a plug for MSD.EXE... it is new with Windows 3.1, (I think)
and comes in the Windows directory, but it will run standalone under DOS.
It's name stands for MS Diagnostics, and it does just about
everything that these PC info programs do... detects IRQ status, LPT
status, your CPU type, your BIOS type, resident TSRs, memory usage,
COM port status, ... (when I say status, I don't mean a dynamic status of
signals on the port, etc., just whether or not it can detect the things
as present, ...)

After trying both a version of KA9Q for Unix, and a separate box, I
agree with Gary's comments here. It's much easier to get the router
working than to make a commercial TCP/IP work properly over the air.

Only one minor correction/clarification though -- it is possible to do
non-tcp/ip packet from the unix system in this environment, if you don't
mind an extra step. You can telnet from the Unix box to the KA9Q box,
and with appropriate permissions set you will get the KA9Q mailbox
prompt, which will permit you to do outgoing ax.25, netrom, or telnet
(but this is silly if you're already telnetting in...) connections. I
do this all the time from work (on lunch hour, of course) by dialing
into the unix box by phone, telnetting to KA9Q on the pc,, and then doing
an ax.25 connect to the local BBS station.

Downeast Microwave makes a 33 element looper centered at 915 for just
this purpose. I've used them in the past and they work fine. Try
to keep the birds off them, though; big birds bend the loops.

Hello,
     Does anybody have any idea about where I could
     get a description of Clover mode/protocol? The
     more "complete" it is - the better, of course.
     I'm going to try to put in on DSP (of course,
     if time, skills etc. allow :-)...

     Please respond via e-mail.

Why do you need v4.04? There is nothing 4..04 will do that 4.06 will
not!

I contacted HAL communications about a month ago and asked the same question. They have decided for the time being that the details of the modulation and the protocol will not be public domain. The only information that is available is in journals where they have decided to publish some information. The level of detail in the Communication Quarterly article is enough to stir the interest but not enough to proceed with implementation.

However, they are prepared to release details of how you "hook" to the protocol so that third parties can develop upper layer software such as mailboxes etc.

We are working on advanced HF systems at my place of employment and have found that development of modems like clover and HF protocols consume many man years of effort. DSP implementations are labour intensive and you really need an HF simulator in order to be able to refine the algorithm. It would take several years of effort in order to duplicate the product developed by the Clover team. I am very impressed with the technical vision and diligence of the HAL team.

Good luck - Please keep us posted if you proceed

Anyone know anything about Bit-Regenerators? I'd like to find a
circuit to put into a TNC-2 to make it a Bit-Regenerator.

Anyone have a circuit to add to a TNC-2 to make it a bit-regenerator?
What firmware (EPROM) would I use to do that? Will a TheNet X1G
EPROM work? Thanks.

I recently downloaded pmnos version 1d from UCSD incoming directory
but have been unable to unzip the file. PKUNZIP reports 'compression
method unknown.'

How do I unzip this file? Any help would be appreciated. 73, Mark. aa2ma.

>email it to you.

I've hesitated to put this file out for FTP in the past, as it's
incomplete. The introductory information (and the ARRL copyright
notice!) has been stripped off the front, and the state tables are
missing from the end. It's almost completely impossible to construct
or troubleshoot the protocol without the state tables.

Jon Bloom at the League has said it's ok to distribute the protocol
specification as long as it's complete and retains the ARRL Copyright
statement, so I'm going to remove the existing file - and hope that
someone does provide the complete electronic version.

Scanning through the discussion that has been posted on news.groups so far, there appears to be support for a reorganization of rec.radio.amateur. I've taken a tally, though I want to caution everyone that THESE ARE NOT VOTES because voting won't occur unless the discussion phase shows enough support to allow us to proceed to a vote.

Tally so far: 13 in favor, 7 opposed, 8 unclear or undecided
Several of the "in favor" messages included modifications to the RFD which may or may not be conditional. So this number represents 13 in favor of a split but not necessarily for the exact proposal in the RFD.

WHAT WE NEED TO DO NOW IS BRING TOGETHER THE SUGGESTIONS WE HAVE INTO A NEW PROPOSAL WHICH CAN BECOME THE "CALL FOR VOTES". IF YOU SUPPORT A SPLIT OF REC.RADIO.AMATEUR, YOU NEED TO REMEMBER THIS IS A DEMOCRATIC PROCESS - LET'S TRY TO MAKE A PROPOSAL THAT CAN PASS A VOTE ON THE NEWSGROUP AND WORK IN PRACTICE. That will mean that probably no one will get exactly what they want. We need to be patient with the fact that other people have input too.

Of the suggestions made for changes, I would like to handle these the same was we did on the rra-reorg mail list. A suggestion needs to appear more than once (by different people) and outnumber the opposing opinions in order to make it in.

Suggestions which more than one person suggested were as follows (opposition is unknown so these are still open for discussion):
* r.r.a.products should be renamed r.r.a.equipment
  - this was a common theme among a few otherwise-dissimilar variations
* r.r.a.space should be created whether the r.r.a.tech option is chosen or not
If there is no opposition, these will become part of the evolving proposal.

Other notes:
* A common concern was that the mail lists will need to match the newsgroups in order for this to work.
* The question of which is supported more between the main set of newsgroups and the r.r.a.tech option is just as unclear as it was in the rra-reorg mail list. More discussion is needed - we definitely need to resolve this.
* a couple responses questioned the r.r.a.digital subhierarchy or whether the groups would be big enough to support a newsgroup of their own. Since this part of the proposal was brought up by r.r.a.packet users and unopposed by others from that group, more comments are needed, especially from r.r.a.packet.

Let the discussion continue... I'll try to put together a picture of what looks like it can pass a vote as people say what they can support.

For reference - recap of RFD proposals

Summary of RFD proposed newsgroups (Option I)

(all groups unmoderated)

Newsgroup name	description
rec.radio.amateur.misc	all Ham radio topics not covered below i.e. video, stories, humor, new topics [no modification to existing newsgroup]
rec.radio.amateur.policy	regulations & policy issues [no modification to existing newsgroup]
rec.radio.amateur.digital.misc	packet radio & other digital modes [includes old rec.radio.amateur.packet]
rec.radio.amateur.digital.tcp-ip	TCP/IP via packet radio
rec.radio.amateur.operating	Operating procedures and questions: DX, CW, contests, propagation, repeaters
rec.radio.amateur.products	manufactured equipment, modifications
rec.radio.amateur.instruction	Ham radio instruction & examination
rec.radio.amateur.construction	homebrewing & experimentation
rec.radio.amateur.space	amateur radio in space: satellites, earth-moon-earth (EME), shuttle, MIR
rec.radio.amateur.emerg-services	emergency services: RACES, ARES, NTS

Summary of RFD proposed newsgroups (Option II - "the .tech option")

(all groups unmoderated)

Newsgroup name	description
rec.radio.amateur.misc	all Ham radio topics not covered below i.e. video, stories, humor, new topics [no modification to existing newsgroup]
rec.radio.amateur.policy	regulations & policy issues [no modification to existing newsgroup]
rec.radio.amateur.digital.misc	packet radio & other digital modes [includes old rec.radio.amateur.packet]
rec.radio.amateur.digital.tcp-ip	TCP/IP via packet radio
rec.radio.amateur.operating	Operating procedures and questions: DX, CW, contests, propagation, repeaters
rec.radio.amateur.emerg-services	emergency services: RACES, ARES, NTS
rec.radio.amateur.tech	Technical discussions about Ham Radio: construction, satellites, theory, examinations, video

>                                       examinations, video

I like the above breakdown.  Although I wonder if there might be some
cross over on the examination issues (as there might be on a lot of
things for that matter).

And for that matter (just for good measure) add a

rec.radio.amateur.flame

Since we have issue that count as flame wars by any definition I've
seen, let acknowledge them and send them to their own pergatory.
(maybe that should be rec.radio.amatuer.static or rec.radio.static :)

A side issue that may help the implementation of a news group
reorg.  Part of the problem may be lack of knowledge of the
definition of the groups.  I would suggest a weekly 'reminder'
of the group definitions.

At a guess, all you need to do is implement the TAPR DCD state machine,
remove the SIO chip, wire RXDA to TXDA and wire the DCD from the state machine
to the PTT line. By doing it this way, your TX will key up when the TNC
detects something like valid data on the input, and the RXD<>TXD link will
cause the TX to exactly reproduce what is being received on the input.

Another method is to put a KISS eprom in the TNC (G8BPQ s/w has a suitable
KISS-only rom image) and wire the RXD to TXD on the RS232 connector. This
will cause the TNC to receive a packet, send it out on the RS232, receive the
same packet on the RS232 and then TX it when the channel is clear.

Obviously the first method is only suitable for repeater-like operation,
because the RX and TX are simultaneous, and there is no checksum calculations
done. It does provide a means of avoiding the 'hidden station effect' because
if all the users TX on the repeater input freq and listen to the repeater
output freq, it will hold off all other users (who see a 'busy' channel) when
any one is transmitting. It isn't 100% though !

73......Dave

So, what you're saying is that a grand total of 28 people have expressed
an opinion and less than half of those were obviously for it ?

You may find that yo need to get the new zip/unzip pkz204g. People
tying to save a bit here and there now have a new version of zip that
cant zip in the old format (but will unzip it) and on top of that
virus checkers reports a virus on the .exe when there is none.

Hi,
  Would it be possible to change the crystal freq and get a higher
  baud rate than the standard 1200 baud. I will be using these modems
  on a special application in the 155mhz band so incompatability
  will not be a problem.

  Any thoughts anyone?

>So, what you're saying is that a grand total of 28 people have expressed
>an opinion and less than half of those were obviously for it ?

Yes. When you ask people to do something out of the ordinary (like go all
the way to news.groups and post something), don't expect everyone to jump to
it. It just wouldn't be realistic. So the fact that those in favor
outnumbered the opposition like that is plenty of reason to continue with the
effort. It may be even more important that the opposition didn't even
outnumber the undecided's... but that wasn't by a significant margin.

Of those 28 people, many or most of them posted more than one article. I
narrowed it down to the number of people because the article counts alone

were skewed much more in favor of the RFD. People would surely have complained if that was what I had based the tally on. (Actually, someone complained anyway. Oh well, it's UseNet - that's what you have to expect. :-)

Hmmm... from the whole RFD experience, I can derive this:

   Kluft's Laws of UseNet:
   1. You can't please everyone
   2. You can't get everything you want
   3. You can't even escape unflamed

:-) :-) simleys required here :-) I've been pleasantly surprised that no one has flamed me yet.

Just one caution about MSD -- in regard to the IRQ display, I have found that it can be misleading. I have added an I/O board to my PC as COM3 at IRQ5, but MSD shows the COM3 IRQ as 4. This means that it is not actually determining the IRQ but rather is showing the non-standard standard value for the COM port, which it is detecting.

Otherwise it is a useful program.

For what it is worth, if we were voting, I'd say NO to
option one (too many groups with too many "precise"
definitions to follow).

I'd vote YES to option two as the fewer the number of
groups to cover the area the better (IMHO).

I _still_ believe the two "digital" subgroups belong
on the same logical level as other r.r.a. groups i.e.
r.r.a.tcpip and r.r.a.digi_misc (or some such name).

I do NOT believe we need/want a separate flame group.

Mark,
   I recall that Walt was shipping an OS/2 version of UNPACK that
was supposed to be used to unpack his code. Look where you found the
PMNOS file and see if there is an UNPACK program there too. I'm not
sure why Walt didn't use the OS/2 version of PKZIP. His unpack
file may be compatible with PKUNZIP, but I haven't really looked at
it. I know that his UNPACK.EXE worked. Now that all of that is said...
it may be called UNZIP.EXE. I know that it was UNsomething, but I
don't remember what it was exactly.

 It has been widely reported here on the net, that no mods to the
RS HT exist. One bogus mode had surfaced some time ago.
 In order to reduce front-end overload ("intermod"), the radio
does not receive frequecies outside the 2 meter band.

Hi,

I don't have 73's release about Poor's man packet TNC. Could someone
send me plans, diagrams to build the modem.
I search others plans, diagrams about simples modems to be connected with
a Macintosh with SoftKiss.
I need informations about the maximum rate of TX with softkiss.

If possible, send plans in GIF, Pict or TIFF.

Many thanks.

Pascal Beaujeant.

Or there are people who, like myself, don't believe in wasting energy
arguing with those who are already convinced they're doing the right
thing.

Simply put, I think your idea of splitting up the various ham radio groups
into splinter interests is bad. There's no use arguing fine points of
what splits would be appropriate; I believe that "none" is the correct
answer.

And so when you guys get through discussing the angelometrics of it,
and put it up for a vote, I'll do what counts - vote for or against it
at the real tally.

And that's why you don't have my pseudo-vote at this point.
     - Brian

I have uploaded to SIMTEL20

pd1:<msdos.packet>
PAX285.ZIP   Hams: Resident (TSR) packet radio terminal pgm.

PAX (ver 2.85) is a resident terminal program written in assemble
with a view towards keeping the code size small and occupying as
little RAM as possible. It has most of the features of larger
programs such as YAPP, yet only occupies 20.8K of memory in its
default mode. It will communicate with two modems, has screen
capture to disk, able to send text files, capture to printer, will
set TNC clock from system, and many other features. The perfect
program for someone who wants to check what's happening on packet
while operating in other applications without exiting the application.

This program replaces PAX252.ZIP and is in ZIP2.0 format.

There was an article on one of the ARRL Computer Networking Conference
proceedings a few years ago that described this. I seem to remember that
NJ7P and N7OO were the authors.

>myself.

I've ftpied the driver from ucsd.edu and it compiles and linked into
Sun4/IPC SunOS 1.4.1 kernel no problem.

However, the following errors generate;
```
     kohjin@cosmos 539% ./ax25 -v jr1ede-1 jr1ede-1 /dev/ttyd1
     popping module: ttcompat
     popping module: ldterm
     pushing module: ax25
```

     ioctl I_PUSH: Invalid argument
I followed README file included of cource.
I would like to know if someone success in the driver?

>I also put a MUD (multi-user dungeon) program on the UNIX machine and the hams
>connected and played together.

What is a MUD? I've never seen in any FAQ.
Could you explain?

Andy,

I've been looking forward to KA9Q NET/NOS for Unix.
At last I've found wampes-930305.tar.Z and related files in ucsd.edu.
It compiles and runs in Sun4/IPC platform even if it's written for Linux.

Please go ahead and upload them, it will be very much appreciated!

I am investigating to see if ka9q with attach (1)PI or (2)SCC AX25 can be used to drive a synchronous modems (up to 14.4k baud) network in a phone multidrop configuration, let the master drop be the router/gateway to Internet.

Has anyone use ka9q to drive synchronous modems instead of TNC yet??

Thanks for any INFO!!!

Usually one has to purchase an "EPROM Programmer", this is a piece of hardware (a card for a PC and holder, or a standalone model) this equipment comes with software to control the programmer and burn the chips in question. They often will handle the variables like programming voltage, IC type, file format type

(hex, binary, motorola ect..). Of course an indispensible tool to go with this is a Eprom eraser (unless you wnat to take the chips into a tanning bed with you :-)

==========
KA9Q: NOSview RELEASE [304]
==========
by Ian Wade, G3NRW

NOSview [304] is now available via FTP on

* *
*   ucsd.edu: /hamradio/packet/tcpip/nosview   *
* *

Download the file:

```
                    * * * * * * * * * *
                    *                 *
                    *   nosvw304.zip  *
                    *                 *
                    * * * * * * * * * *
```

NOSview, first introduced in September 1991, is an on-line documentation and runtime package for the KA9Q Network Operating System (NOS). It contains:

++

*** probably the only complete reference work anywhere that describes all of the commands to be found in the major NOS releases.

*** a TSR file viewer that lets you read the NOSview documentation on-line, without breaking out of NOS.

*** NOSgas: the "NOS Get-Away Special" -- a complete set of working NOS runtime software, based on the PA0GRI 2.0m release.

*** a complete set of templates for the NOS control files.

*** full details on how to get the book "NOSintro", which describes in detail how TCP/IP works and how to use KA9Q NOS. Ideal for beginners to TCP/IP (and more advanced users will find many gems of helpful information there as well).

++

NOSview [304] contains many new documentation files, and the template NOS control files match the listings in the book "NOSintro".

Extras include ....

    UUENCODE/UUDECODE file conversion utilities
    AX.25 Baycom Packet Driver
    KISS protocol documentation
    HOSTS <> DOMAIN conversion programs
    PCElm and ELM Mailers
    The Clockwork VIEW TSR file viewer

As NOSVW304.ZIP is quite large (around 700 KB), you may prefer instead to get your copy by mailing a DOS-formatted diskette (any size EXCEPT 360 KB) and return mailer to:

Ian Wade, G3NRW
7 Daubeney Close
Harlington
DUNSTABLE
Bedfordshire
LU5 6NF
United Kingdom

Please enclose return postage as follows:

United Kingdom:	UK postage stamps
Rest of Europe:	3 IRCs
The Americas, Africa:	7 IRCs
Rest of the World:	9 IRCs

(Any unused IRCs will of course be returned).

There is no charge for NOSview, so please do NOT enclose
any form of payment.

73 de Ian Wade, G3NRW

February 1993

P.S. If you would like full details of the book
"NOSintro", please email me direct:

ianwade @ dircon.co.uk

--

* * * *

I just uploaded a UART identifier to ucsd.edu, in file
hamradio/packet/tcpip/incoming/is16550.zip.

Please Brian, put it in what directory you think most suitable.

There are *NO MODS* for the HTX-202, the previous mentions of mods were proven to be false. A friend of mine is a technician for Tandy service and he services that particular radio, he has found no way of modifying it as of yet.

Approved: w8sdz@tacom-emh1.army.mil
Lines: 20

I have uploaded to WSMR-SIMTEL20.Army.Mil and OAK.Oakland.Edu:

pd1:<msdos.packet>
PAX285.ZIP   Hams: Resident (TSR) packet radio terminal pgm

PAX (ver 2.85) is a resident terminal program written in assemble with a view towards keeping the code size small and occupying as little RAM as possible. It has most of the features of larger programs such as YAPP, yet only occupies 20.8K of memory in its default mode. It will communicate with two modems, has screen capture to disk, able to send text files, capture to printer, will set TNC clock from system, and many other features. The perfect program for someone who wants to check what's happening on packet while operating in other applications without exiting the application.

This program replaces PAX252.ZIP and is in ZIP2.0 format.

Anyone out there run into this problem? I just had AEA install their
2400 baud modem upgrade in my PK-232. The unit has both the TAPR DCD
state machine mod and the TAPR modem disconnect board.

The original functionality is fine, but when the new modem is selected,
the state machine appears to be out of the picture, and the DCD doesn't
work properly.

I'm in touch with AEA and TAPR but I wonder what the net.experience is
with this, if any.

Thanks for any info. -Seth

I don't think this is a FAQ, but beg y'all's pardon if I'm wrong.

I'm just getting into packet radio, and notice that a lot of folk are using Commodore c-64's. Also notice that MFJ makes an inexpensive modem specifically for the c-64.

I have an old but excellent c-64 I could dedicate to the shack (unlike the DOS boxes around here, all of which are used for a lot of different purposes). Could someone tell me what ham-related software is available for the c-64, and where I might get it? I have no modem for the c-64, and presumably it would not be very helpful to download c-64 software in DOS format, so I guess I'd need to get the actual c-64 disks (I DO have a disk drive).

Incidentally, I DO know there's a lot of difference between 64k slow bites and 4 meg of fast ones, but since I've got the gear anyway, if the software doesn't cost much, it seems like an efficient way to get started.

Thanks and 73!

  I am looking for the "9600 bds handbook" describing how 9600 bds ham modems work (text or postscript file). I have seen this file on a UK BBS a few months ago.

 Please answer to dbillon@u.washington.edu.

73, Damien, N7/FC1PLI.

Has anyone successfully used the TAPR State Machine DCD mod as a Bit
regenerator? We normally use Bell 202 modems tied in loopback mode and
they seem to work fine for a regenerator. I am looking for any comments
and or actual use of the TAPR system...

Lines: 29

Hi,
   I will try to keep from showing my frustration - but I recently bought an MFJ 1270 and I am definitely not having fun yet. I am trying to get it to work with my Yaesu FT470. I can recieve information just fine. I can connect to myself after installing jumper 10 (digital loopback). I just cant get it to key the xmitter. I have read the manual about JMP K. (Why oh Why did they not put a jumper block for JMP K? - Why didn't they label the soldered over holes for the jumper better?). The first bad thing I did was put a jumper into the two holes indicated by the JMP K label on the PC board. Wrong!! I have fixed that and put a jumper where JMP K really is. I still get no PTT. I have measured the resistance when the PTT light is on and I get ~47K ohms.
Is this going to work with my Yaesu? Someone told me that the resistance between the MIC pin and ground should be < 10K ohms before the radio will key the xmitter. Is this correct? Do I need to change resistor 107? What value?

So far I am really not impressed with the documentation for my TNC. Would it really have raised the cost of the TNC that much to have put a jumper block for JMP K - what if I want to use two radios? Can anyone point me to an FAQ or other written material regarding interfacing MFJ 1270's and Yaesu HTs?

Thanks

>impossible.

There is also a third problem which has caused some flaming here in the UK:

     Handheld designers don't always pay as much attention to interference potential as designers of higher power rigs. Transmit inhibit seems to dissapear BEFORE the synth is properly locked, thus causing momentary transmission on the wrong frequency as the synth moves from RX to TX frequency. This is probably not that important
for temporary use portable or with small antennas but has caused some irritationc to users of 144.600 (RTTY) here in the UK, as signals destined for 144.650 (packet) drift through their QSO's every few seconds!

I'm not trying to dissuade people from using handhelds for packet (in fact I am considering using one myself to liberate my multimode), and I have no idea how widespread the problem is - just be aware of it.

Distribution: ca
Message-ID: <1o37reINNa5t@gap.caltech.edu>
NNTP-Posting-Host: hss.caltech.edu

We have a copy of wg7j 1.08 NOS running on packet and the internet at Cal Tech. This system has a 9600 baud packet radio on 70cm from which you an connect to a local bbs, a local node which can get you out to other locations in southern california, and even las vegas and phoenix (or further) via other mountatintop systems. There is also conference or roundtable type system in the area where a half dozen ito a dozen congregate every evening. A 2m, 9600 baud port is in the works and should be completed shortly.

I am prepared to accept memberships in a "Caltech Packet Gateway Group" (or whatever we decide to call our subgroup of the campus radio club) from random FCC LICENSED individuals on the internet.

The Caltech Radio Club Packet Gateway Group, shall

* maintain and expand a packet/internet link at Cal Tech
  in accordance with FCC rules and the interests of the developers.
* facilitate the expansion of packet facilities in California
* act as a collection of people knowledgable in high speed packet, networking, and other technical types throughout the southern california area.

(hopefully this will also provide for some continuity in my absence)

Currently we have a 386/25, some radios, some hardline, and a makeshift antenna. We need a decent 2m/440 antenna. Also, the equipment must be remoted on a higher building where we will have line of sight to much of la and orange counties.

In the long term, we would like to
R&D some high speed packet stuff and/or get space from coordination bodies to get 56KB or higher speed packet going in california.

I honestly do not expect to be around much more than a year and a half, however.

Some information may be found by anonymous ftp to w6ue.caltech.edu.

At this time, I am interested in getting a list of individuals who are interested and would not mind joining a support group ($$) so that we can improve the system. I and several others have contrbuted over $1000 of equipment in order to get started, and quite frankly feel the need to go to a user-supported system.

Operators callsigns will be automatically transmitted when you are using the system (just like your radio + tnc was on our tower). Proof of license of technician (no-code ok) or better license will be required before we will give out passwords to access the system. At first I would like to limit membership to a dozen or two interested persons. The system can handle multiple logins, but I must emphasize that we just got the system functional a month ago and need to fund some improvements before feeling

comfortable opening it up more.

Current FCC rules make accessing INTERNET from PACKET fairly unworkable. Also, on a 9600 baud radio channel you at most get 1200 baud or so of service (remember you share the channel with others). Thus, capacity is not up to the traffic volume found on internet. Also, this seems to me to be mainly a way of avoiding telephone use and/or paying access fees. I don't want to tie up busy radio channels because some one is to cheap to pay whatever netaccess costs these days.

reply to: pjb@hss.caltech.edu

I will see how many responses we get in a week or so, and decide then how we shall proceed.

Try one of those little Yaesu 747GX's. Cheap and will get u by with the same throughput as any other. Unless you want to get fancy and run your packet in TRUE "FSK" mode. Then of course you'll need one that has FSK mode on it!

There is also one in the NOS docs, NOSVW304.ZIP, available at ucsd.edu also.
It is an executable, in case you don't have an assembler.
I haven't used it, but it is an ax25 driver designed specifically for the NOS
programs, and a BAYCOM-style modem.

That was why I was looking for the schematics to the modem earlier, I want to
free up my TNC for my other computer, instead of running my BBS on it.
I'll post a result report as soon as I get it built (hopefully in the next week
or two).

     I was wondering if there was an archive site where I can get all or most or
the past articles that were posted here. I am trying to get all the info I can on
packet radio for a friend of mine without net access. I have the faq, but I think
that the messages from here would also be a help to him. He is just starting out
in
this field, has no equipment, but really wants to get into it. Any help would be
greatly appreciated.

Dan: I built a Baycom modem by modifying the schematic found via FTP at
ucsd.edu. The file name was TCM3105.ZIP and contained a postscript file
for the schematic and a parts list.

The Tigertronics modem that I was using, which got its power from the RS232
port, gave me a lot of trouble. It did not generate true RS232 signal but
depended on the COM port being able to recognize TTL levels as RS232. My
computer could not. The schematic at ucsd.edu does the same thing - it
sends TTL levels to the computer.

The last straw was when the Tigertronics burned out and took my RS232
driver from the COM port with it. After fixing the COM port, I decided to
build my own packet modem rather than trying to fix the Tigertronics. I am
using an AMD7911, which is jumper selectable for 1200 or 300 baud (in case
you want to try HF packet) but is not a CMOS chip and thus cannot be
powered from the COM port.

I designed it in its own box with its own + and - power supplies. I
receive RS232 from the COM port into an MC1489 and send RS232 to the COM
port with an MC1488. I finished it a couple of weeks ago and it has been
working wonderfully.

After building it, I was trying to fix a PK88 and imaging my surprise when
I saw what they used - an AMD7910.

Good luck with packet.

I have several questions regarding the use of the KA9Q program and NNTP servers. Any answers will be appreciated. For those who don't know, KA9Q is a program that runs under MS-DOS, that allow one to connect to the Internet using SLFP or PPP protocol (an external driver is needed for SLFP; it's possible that SLIP may also be supported in this way). KA9Q was originally written for use by radio amateurs, but also seems to work well on dial-up Internet links such as those offered by Michnet (in Michigan). I know that some of you who are more familiar with KA9Q will probably laugh heartily at this feeble explanation, but I'm still fairly green at this.

Anyway, what I am trying to do is figure out how the NNTP client in KA9Q's NET.EXE program works. I have been unable to find ANY documentation that even begins to explain it. Nevertheless, I have figured out how to get it to receive newsgroups from a NNTP server (though I'm even having a few minor problems doing that, which might be resolved if I had better documentation). I cannot figure out how to get it to POST messages to an NNTP server (I realize that not all NNTP servers accept posts, but even in the case of those that do, I have no idea where KA9Q looks for outgoing messages, nor what sort of control files it might expect).

So, I'd like to know where to find some really complete documentation for KA9Q, or failing that, a KA9Q expert that might be willing to answer some questions about the more esoteric points of KA9Q operation. As I say, the documentation I have it pretty abysmal (it doesn't even

tell how to configure the BBS functions of KA9Q). The specific things I need to know right now are how to post a message to an NNTP server (that accepts posts), and (if possible) how to keep it from creating subdirectories for newsgroups you don't want (when a message has been posted to multiple groups).

I'd also like to know if there's a particular newsgroup where it would be particularly appropriate to ask further questions about KA9Q, or even a KA9Q-related mailing list.

As for NNTP servers, as I mentioned, I have noticed that relatively few permit open access. This strikes me as just a bit odd since some of them are operated by the same organizations that operate Gopher systems. From where I sit, it is far more efficient to capture all the new messages in a newsgroup and read them offline than to spend time on a Gopher system trying to read messages online one at a time. If someone could explain to me, without flaming, why so many NNTP servers are closed (either do not allow access at all, or do not allow posting access to those outside their organization), I would appreciate it. As I say, it just strikes me odd that some organizations have no problem with folks tying up their online Gopher servers for hours reading news, but don't seem to want folks to have an easy way to capture new messages in a newsgroup and read them offline.

I'd particularly like to find one or more open NNTP servers in the State of Michigan, if anyone knows of any. Failing that, I'd like to know of any in North America. I am told that they used to be plentiful but for some reason, many organizations have restricted access to them. It seems there may be a real need for a greater number of "open" NNTP servers, should anyone care to provide them as a public service. Again, I ask that you not flame me if there is a good reason that such access was discontinued; I haven't been around long enough to know of any incidents that might have led to such action. Please explain, but gently!

I also wonder if it would be possible to offer access to a NNTP server as a menu item on a Gopher system. This would allow those of us who can dial into an online Gopher to connect with the server and pick up messages from various newsgroups without having them interrupted by control codes, screen clearing codes, etc. Of course, a similar function could be implemented by a revision in the Gopher software, but that would be far more difficult.

I hope these aren't terribly dumb questions, and I *really* hope that somewhere out there, there exists some decent documentation for the KA9Q package. Any help at all will be appreciated!

Oh... PLEASE... I posted this message to several newsgroups since I wasn't sure which one would be the best one, and it's a real effort for me to post a message right now, so I have to make it count. When you reply, PLEASE reply via mail, or if you can't do that for some reason, please prune the Newsgroups line to a more selective subset, or enter a new message with the subject line of "KA9Q and NNTP", or do ANYTHING

other than just a straight reply to all the newsgroups in the header,
let we both get flamed!

Jack

Many Canadian Delegated examiners charge $0, perhaps, Colin, people in
Toronto make money on it :-)

Communications Canada, as of April 1, will increase the licensing fees
to $30Can (about $2.45US :-) :-)

Fine advise otherwise Colin.

In case your wondering what a Bowtie filter is, I will explain
it in the April Issue of Monitoring Times "Reading RTTY" column.

I find that the filter is great for packet because you can tune
your receiver to a ten Hz accuracy. You may think that it's not
necessary to have such resolution but tests show that if your more
than 20 Hz off frequency you start to loose error performance on
H.F. packet.

I think that's one reason why Hams are have such difficulties on
H.F.

Subject: Packet Radio via CB????
Lines: 32

I am thinking of a cheaper version to connect to the University.
I want to bring down my online phonecosts (we have to pay per
minute).

Questions:

Is it possible to run Packet Radio on CB Channels?
(the range of CB would be OK)

(It is very very very hard to get a amateur radio licence
and it is very very very expensive to run a commercial radio)

I am in Europe, so this is not a question of laws.
We have our -----spezial------- laws.

Which hardware can/must I use?
What are the costs of these hardware?

Can I realize a Network with more than two nodes and no
need for manual interaktion. (I wish to realize TCP/IP with one
central servernode). The network should have more than 10 nodes.

How many channels would it need?

Is it possible to build relais stations (for longer range)?

What is the maximum bps over one Chanel?

Is there Software to run these under DOS?
Is there Software to run these under Unix (Linux)?

Thanks in advance. Ed

RE: Poor Man's Packet on serial ports with BAYCOM style modems.

Hello. This is Bob, KI5PG, in Victoria, Texas. Recently I read a
packet message asking if it was possible to use Poor Man's Packet
on Baycom style modems. It is.

My good friend, Harvey, WB5MCT, a brilliant ham and a fine person,
came up with the solution. About a year ago, Harvey and I got
hold of some old BELL 202 style modems used on a dedicated phone
lines for remote computing. With a few external components we
managed to get them working on packet with BAYCOM 1.4. (If you
can scrounge some old BELL 202 style modems and you want to know
the modifications, let me know.) Harvey, WB5MCT, made the PMP.CFG

changes to make PMP address the serial port addresses to make PMP work on the BELL 202 serial port modems. These changes should make PMP work with any BAYCOM style serial port modem.

Change the following parameters in PMP.CFG to the values shown below. (This causes the software to address the "handshake" bits on the COM port instead of the Parallel port.) The addresses given are for COM1 serial port. For COM2, change the port addresses from 3FC to 2FC and from 3FE to 2FE.

```
# PTTPORT
pttport 0x3FC 2 0
# TXPORT
txport 0x3FC 1
# CDPORT
cdport 0x3FE 128 1
# RXPORT
rxport 0x3FE 16
```

Try it. It works for us. It should work for you, too. All this is interesting to play with but if you really want to work with the PMP type program on a BAYCOM style modem I would suggest you get the SofTNC program from j*COM. SofTNC and Poor Man's Packet are both written by Andrew C. Payne, N8KEI and I would be remiss if I did not give Andy credit and thanks for both of these fine programs. Although PMP is released as shareware, SofTNC is a commercial product. The program runs about $20.00. I bought it and I enjoy it. It has a few features that make it superior to PMP, specifically, it has a keyboard buffer so you do not get locked out and lose keystrokes when the program is receiving data. In other respects it is very similar to PMP. It's worth the money and j*Com will ship it out to you right away.

If you want to know how to modify old BELL 202 serial modems to work VHF packet radio with either BAYCOM, SofTNC, or PMP, send me a SASE and I will send you back the details. My office address is 121 South Main Street, Suite 205, Victoria, Texas, 77901. I'd also like to know if you made it work and if you found this information useful. You could also send me packet messages at KI5PG @ KB5JBQ.SO.TX.USA.NA.

73 de Bob, KI5PG, in South Texas.

>We have our -----spezial------- laws.

Subject to whatever legal restrictions you have, yes it's technically
possible.

>Which hardware can/must I use?
>What are the costs of these hardware?

An ordinary TNC should work nicely. Even the little Baycom type units
will work at 1200 baud.

>Can I realize a Network with more than two nodes and no
>need for manual interaktion. (I wish to realize TCP/IP with one
>central servernode). The network should have more than 10 nodes.

Yes. Use the KA9Q NOS software.

>How many channels would it need?

Depending on channel loading, only one. If the load gets really heavy
you may want to split the nodes among several channels and use the
switch computer to gateway between them. A typical router application.

>Is it possible to build relais stations (for longer range)?

Yes, either smart or dumb. It's built into the KA9Q NOS code. Any station
can serve as relay for any other on the same channel.

>What is the maximum bps over one Chanel?

1200 baud is probably a practical limit, though 9600 might work in
exceptional circumstances.

>Is there Software to run these under DOS?
>Is there Software to run these under Unix (Linux)?

Yes and yes. KA9Q NOS to both questions. There are a bunch of varients
of NOS, one or the other will meet your needs. Plus you get the source
code so you can modify it to fit if necessary. This is the greatest deal
in networking.

I will be wanting to add packet radio to my system in the near future, having
not yet taken my amateur radio test in the uk to obtain a callsign.

Can someone give me some pointers on what the best TNC and Rig for 2m transmission
would be. Also, how do I obtain an IP address for my callsign ?

All help gratefully received,

Nick

The term FREEWARE used to mean the same as SHAREWARE. Nowadays, it
usually means software where the author keeps the copyright, but allows
free user of the software, but I'm not too surprised to see the term used
with the old meaning.

I have seen at least one driver for NOS that will allow NOS to be used
with a Baycom modem, but can't remember where I saw it. If you have FTP
access, you may want to check some of the 'usual places' for finding NOS
software(tomcat.nasa.gov, ucsd.edu(??)). If you have UUCP or regular
dial-up software, try the WB3FFV BBS(which should be in the nixpub list).

Is it legal, (FCC Wise) to run packet radio links on a privately owned
commercial radio freq? An organization that I work part time for is
interested in doing this for work between shops.

Thanks,

 I remember they are using 145.550, same freq as with their FM simplex
qso's...as a matter of fact i have heard them on this freq, but i dont
know if they do use it nowadays...

>Thanks,

There is no such thing as a "privately owned" radio frequency. There are
different rules about permissible modulation modes for each service. Generally,
data transmission is considered a special mode and requires special
authorization, but users in several public safety frequency groups have
obtained licenses for F9 (frequency modulated data or other) transmission
on top of other uses of the same channel. Refer to part 90 of the FCC
rules, available at your library in section 47 of the Code of Federal
Regulations. Post or email the frequency and service and I'll try to look
it up if you like.

Yep. 145.55 MHz. They tend to be a bit sporadic, so it takes a little
patience. Good luck.

Just recently bought an Advanced Electronic Applications Model PK-232MBX
TNC. Does anyone have any idea about configuring it? What com port is
it set to? I am assuming com1: but it will not respond. This may be
due to the interface card in the computer. Any input would be
appreciated.

          Thanks in advance, C. Lind

I got the attached request for packet assistance from Poland. It's a
bit out of my area but I told him I would post it for him. The mail
headers are a little screwed up but his address appears to be

     slawiec@usctoux1.cto.us.edu.pl

If someone here could help him out I'm sure he'd appreciate it.

Devon

Message-ID: <9303181423.aa00693@usctoux1.cto.us.edu.pl>

Dear Sir,

I am especially interested in establishing local area pocket or ham radio
internet transmission for a group of scientists from a university in Poland.\
I have no idea how to start such works , where to oder necessary equipment
or hardware, any suggestions and opinions how it works in he States
would be welcome.
your sincerely,
Slawiec,M.Sc.

Or please forward my request to a respecting discussing list or concerned mbody.

Lines: 8

What types of TNC an available?
Where can I get them? (I am living in Austria, near Germany)
What are the differences between them?
How much do they cost approximately?

Please add these questions/answers to the FAQ!

Thanks ED

You can use KA9Q NOS or one of it's variants and the AX.25 packet driver.
Various versions of NOS can generally be found on ucsd.edu in the
hamradio/packet/tcpip directory. The Baycom style ax.25 packet driver is
in hamradio/packet/tcpip/ax25.

Check the first few pages of the manual. It will tell you what parameters
that the TNC is set to before being shipped from the company. Make sure
that you have in fact connected the TNC using the shielded cable to the COM1
port of your computer and not COM2. This may be a factor if your computer
has a moden and a serial port OR two serial ports. Using the software
package make sure that the appropriate COM port is configured to the TNC
initial parameters (as described in the manual). I'm not at home so I can
not give them to you - but if you have further questions send EMail to
SEELER@UPEI.CAnot the list and I will be able to help over the weekend.

I have printed out a PS document called 'A High Speed Software
DES Implementation' by David Feldmeier, and it refers to
Phil Karn's DES Implmentation source code. Unfortunately it does
not say where this source code can be ftp'ed from. Can
someone please point me to ka9q's des source code?
Thanks in advance

Subject: INFO: TAPR state machine revealed (a little)
Message-ID: <1993Mar19.161502.152662@locus.com>
Date: 19 Mar 93 16:15:02 GMT
Sender: news@locus.com (Netnews)
Organization: Locus Computing Corporation, Los Angeles, California
Lines: 127

I spent some time looking at the TAPR State Machine 1.0.9 and 2.0.0
ROMs. I wrote a short program which allows one to simulate State Machine
operation, including both a 1.0.9 image and 2.0 image.

I was interested in particular in the rumor that the 2.0 ROM is more
likely to false in the presence of noise.

I determined that both versions will output an active DCD state if
the data input has no transitions. This confirms my earlier suspicion
which I had posted here on rec.radio.amateur.packet and been told I was
wrong :-). Further, the TAPR 9600 baud modem manual explains that the
state machine does not look for transitions in the right place, instead
it looks for transitions in the wrong place. A steady data input will be
free of transitions, which includes the wrong place, too. So there.

I wrote a short program which generates a pseudo-random sequence of
data input for the DCD program. Using the test data generated, I discovered
the 2.0 state machine is *less likely* to false than the 1.0.9 machine.
If, as is rumored, the TAPR 9600 baud modem is subject to a lot of falsing,
it is not because the State Machine is more sensitive; it would be because
the external timing network in the 9600 baud modem does not have long
enough timeouts; I'll look into this later.

For giggles, here's a cheesy simulation program. No comments on style,

please! :-)

```
/*
 * DCD simulator
 * Dana H. Myers, KK6JQ
 * State Machine Images (C) Tucson Amateur Packet Radio, Inc.
 *
 * Input data is a series of one and zeroes, clocked at the State Machine
 * clock rate.

I don't know either, but that's because I use a mail-to-news gateway site
for posting my news.

> how to keep it from creating
> subdirectories for newsgroups you don't want (when a message has been
> posted to multiple groups).

The version of KA9Q I use collects the news as a single file (called

batch.txt). I then use another program to split that batch up into
separate files for each news group, and read the files.

I use cppnews, a news/mail program that I wrote myself, to do this. Others
who connect to Demon Internet Services mostly use either cppnews, or a
version of SNEWS.

Both cppnews and the D.I.S. version of SNEWS only post news to the groups
you have selected.

C'mon Gary, have you tried it on AM? You have to be prepared to watch the
paint dry even on SSB on HF at 300/1200 or 9600 because it is darn hard to
get a reliable packet through!

Try the 65cm FM CB band, or even the 49MHz or 900MHz FM toy band, you will have
far better luck getting through. The CBers will jam you at any possible
chance if you go to 11M CB, irregardless if legal or not (it is NOT legal,
since the ITU agreement on 11M prevents it ...)

I've hacked at it a bit. If you examine the schematic it seems fairly
obvious. The receive connection is made at the discriminator ic (pin 9
i think). I've tried injecting the xmit to the varactor via 1 of the
pins on the connector with the single jumper wire on it (white wire on mine).
The problems I have run into is that xmit works fine, rcv works fine, BUT,
they don't work together. As soon as I hook up the xmit side, the rcv sides
goes deaf. Someday I'll work on it some more, but, go ahead and take a shot
at it! I haven't blown up any of my radio's yet!

Greetings!

Does anyone know where I can get 1200 baud fsk modem chips?

I have a need for about 6 - 12 of them for a radio-modem tinkering
application..
              Thanks in advance!

                   Regards,
                                       Lonnie-

Ed,
having lived in Germany for two years, I assume you mean AMATEUR packet
radio - there is PLENTY around in Germany/Austria on 430 MHz. If you mean
CB, then you're 1) writing to the wrong newsgroup and 2) you have no idea
what you're talking about since there are no CB packet networks in
Germany. 73.

Please note that the ITU has *no* regulations about CB. CB is not an internationally recognized service. It's within each jursidiction's responsibility to make their own *exceptions* to the ITU regulations to allow a CB type service. Also note that the orginal poster is not in the US and so is not subject to US regulations.

Now as to use of packet on AM, it works fine as long as the signals are strong enough to give a 20 db SNR. I've had great success using packet on some *commercial* AM channels here in the US. It works much better than SSB because tuning errors don't affect the tone frequencies. Note that this is for point to point engineered links, not random skywave contacts. Skywave AM suffers too much from selective fading due to multipath. I have no doubt that it would also work on Class D CB, though it is illegal under *US* regulations to do so *here*. Other jurisdictions have different rules. Skywave signals from high power US CBers might make the channel difficult in the daytime though.

Gary

How are you all doing? My local board (montreal) has just picked up this
internet echo. Glad to see it. You have arriced at just the right time.

I passed my amateur exam three days ago, and I am very interested into getting
into packet. I have yet to buy a radio, it's purchase being contingent on
being able to wirte it up for packet!

I am using only a wyse terminal at home, no PC (I know... what a mutant! :))
or anything like it. Anyone have some suggestions?

Hi:
     Has anybody connected the new Alinco DJ-180t (H/T) to a tnc yet.
I would like to know the connections and what kind of cables I
would have to make up. I have a KPC-3 tnc. If anybody has any
information on this radio or on connecting an Alinco H/T. I sure
would be grateful for it and to you. Thanks and 73's

I recently received a KPC-3 as a gift and have been trying to get it
up and running during the last two days with limited results......

I've got it hooked up to an FT-470 and the connection seems to work
fine, only it is intermittent.

On the other end of things, I have been using a friends Tandy laptop
while in the process of setting up the TNC and rig and I have noticed
an anomaly which have me now wondering if I have a TNC problem.

When I connect the computer, TNC, and radio together (all powered off)
then turn them on in the same order, everything seems to work just fine.
However, if I shut the computer off and/or disconnect the 9-pin
serial connector from the laptop, the TNC 'appears' to continue to
function (i.e., accept outside connections to my mailbox, digi, etc.).
The problem is that in actuality, even though the TNC xmit led comes on
during transmit, the rig does not go to PTT. It just sits dormant.
I have tried reconnecting the computer to see if the problem goes away,
but only have been successful re-establishing PTT by shutting everything
off, disconnecting/re-connecting, and powering everything back up again.

It appears that the TNC does not put the radio into PTT once the serial
connection to the computer I am currently using is severed.

I have been using a borrowed PacComm (sp?) TNC previously and have had
NO trouble leaving just the TNC and radio on during the day, shutting
the pc down meanwhile. Is there something about the KPC-3 which requires
a 'live' PC at the other end full-time in order for it to work and go
about it's business? Or could there be something wacky about the laptop
(tandy) which I am currently using?

I do have an old XT dog in the cellar which I hope to try in lieu of the
portable soon but just haven't had the time to get down there and
set it up.

Suggestions/comments most welcome. Thanks.

mla

Received my copy of NOSIntro from CAPRA yesterday and just wanted to
say THANKS in public.

Not only is the book great, but it (unexpectedly) came with software,
the price was great and the service was great. Gee that's a lot of
"great"s, but I guess you can tell I'm very pleased. I mailed them my
order only 9 days ago...

Now if I can get my IP address I'll be ready to go -- where did I put
that coordinator guy's phone number...   :-)

For anyone who missed the original posting, it came from
jchesner@holonet.net and CAPRA's address is:
     CAPRA - Chicago Area Packet Radio Ass'n
     P.O. Box 8251
     Rolling Meaddows, Illinois 60008
Send check for $22.50 with your complete mailing address and a phone number
in case of problems.

A happy NOS'er ... -Seth

Subject: Packet via Telnet: join our gateway!
Date: 20 Mar 1993 22:10:35 GMT
Organization: California Institute of Technology, Pasadena
Lines: 231
Distribution: usa
Message-ID: <1og4orINN3tn@gap.caltech.edu>
NNTP-Posting-Host: hss.caltech.edu

The following is an example of using the W6UE Internet->Packet Gateway
at Cal Tech. The system consists of the following components:

386/25dx clone. Floppy Drive only. 2 Meg Ram.
8-bit NE1000 clone ethernet card.
drsi pcpa III with 9600 baud TAPR modems (plug in tnc-equiv card)
motorola mitrek, 30W on 439.025 Mhz at 9600 baud into a makeshift antenna.
(being converted) icom 22, 10W on 144.99 at 9600 baud into ?

The plan is to raise support from people who wish to use the gateway, and
to purchase a repeater-grade amateur antenna. This will cost $200-$300.
Currently the antenna is in a hole and does not work very well. We have space
on a tower at 70ft and hardline for the installation. After that we need
to think about adding other channels, or perhaps 56KB, etc...

Below is an example of using the gateway.
For information on access, write: pjb@hss.caltech.edu
Permament access to supporting users only! Figure around $20/yr or so.
If you want to try it out, be sure to include: callsign, birthday, exp. date.
I will use the latter information to try to see if ur license is real.
You need a technician (nocode ok) or better license. US licensees only.
(US licensees abroad are ok. Foreigners should find a gateway in their nation)
QTH: Pasadena,CA near Los Angeles with good coverage of LA and Orange counties.

Greetings Paul. I am responding to your recent packet bulletin. I would like to say this. From your statements you can tell many things about you, some that are the way you think about what you see. While you shared with us your opinions about not wanting to see, and hoping others take some kind of action against, certain types of messages such as GUNS, GAYS, ETC... as well as CRIMINAL ACTIONS AND FBI INVOLVEMENT, you failed to point out why this is wrong, other then your dreaded, and somewhat unfounded, fear of the return to Channel 19.

I find it very interesting and would like to follow with FACTS:

1) Most Ham's that I have spoken with, and myself included, were at one time CBer's. It's funny how some look back at it now as trivial, and because of their much improved radio communication skills, refer to it as 11 Meters. Who is kidding who? The nose your looking down now is the same one you used when

you had a CB mic at the other end of it.

2) What your suggesting as far as taking these people aside and and setting them straight, I would like you to state where in PART 97 they are violating the rules of good operating procedures. They are passing information, whether of a personal or technical nature, that they think others may want to know. Surely, your not suggesting that they type these messages for the sake of high hopes at gaining access to arthritis in the hands, failing eyesight for looking at the monitor in front of them, not to mention exposure to RF. No, you couldn't be!

3) You talk about such message sender's, and the ingnorance they exhibit. I would hope, as an American Citizen, your not saying that we should not allow folks to speak their minds. That we should censor their comments, and call them childish names when they do not conform to our way of doing things. Seems to me there have been countless people in this world's human history that have made such idiotic statements. Does the name Hitler stand out...

/* thats quite enough (i'm not the same paul mentioned here by the way) /*
/* who says flame wars are confined to netnews ? /*

Connection closed.

Good morning. It's Sunday the 21st of March and here is the GB2RS news

broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- An RSGB Council Member is the Amateur of the Year; a statement about RAEN Limited; and there are two new RLOs.

The RSGB's Project YEAR Coordinator, Hilary Claytonsmith, G4JKS, has been awarded the title 'Amateur of the Year' by the magazine Ham Radio Today. The announcement was made at the London Amateur Radio Show last weekend. Hilary is a member of the RSGB Council and her work in the fields of EMC, HF Contests and recruiting young people into amateur radio is well known to members. Our congratulations to her.

At the RSGB Council Meeting held in London on the 12th of March 1993, an application from RAEN Limited for Affiliation was discussed, and considered at some length. Council decided that the Society were able to affiliate RAEN Ltd as the Management Committee, but not the individual Groups associated with RAEN Limited. However, the Society sees no reason why individual Groups should not seek affiliation in order to obtain the benefit of the use of the Raynet logo, in accordance with the notice which appeared in the January edition of Radio Communication, together with the enhanced Insurance Cover, recently negotiated by the Society, and receipt of the Society's house magazine. The current arrangements for insurance cover will expire at the end of June 1993. As from the 1st of July 1993, emergency communication groups operating under the name of Raynet, whether they be associated with RAEN Ltd or RSGB Ltd, will not be covered by the RSGB Ltd (Raynet) insurance unless they are affiliated to the Society. Groups who are associated with RAEN Ltd and who affiliate to the Society will not be required to register their members details with the Emergency Communications Officer, for the purpose of insurance cover, provided their details are properly registered with RAEN Ltd. Groups who are not associated with RAEN Ltd will be required to register with the Emergency Communications Officer in accordance with the current arrangements. Note: Only Groups with the name 'RAYNET' in their title can be covered by RSGB (Raynet) insurance. These are conditions imposed by the Insurance Company. A full statement and explanation for Council's decision has been sent to the Company Secretary of RAEN Ltd at the Company's registered office.

News now of the appointment of two RSGB Liaison Officers (RLOs): For the Lancashire/Greater Manchester area it is Mr Bob Catlow, G4ARP. His address is 137 Haven Lane, Moorside, Oldham, Lancs OL4 2QQ and his telephone number is 061 652 8617. For the Merseyside area it is Mr Keith Brookes, G0SPH. His address is 43 Northwood Drive, Windmill Hill, Runcorn WA7 6QG. His telephone number is 0928 701096. RLOs hold a wide range of information and should be used by RSGB members seeking advice.

A new UHF voice Repeater GB3CG is scheduled to become operational at 12.00 hrs on Saturday the 27th of March. The repeater will be on Channel RB14 and is located near Blaenau Ffestiniog, Gwynedd. Further details and/or reports to the Repeater Keeper, GW6IMS, QTHR.

We are sad to report that Lieutenant Commander Ellis Diggle, G3LSD of Stoke Damerel, Plymouth died on the 1st of March. Until his recent illness, Ellis was a GB2RS news reader on 80 metres. The news is now read from Plymouth by G0LRJ.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Tuvalu, JF1WQC will sign T20WQ from now until Tuesday the 23rd of March on all bands, using CW and SSB running 100w to an all band vertical. He will then move to Wallis and Futuna, and will sign FW/JF1QWC from Wednesday the 24th until Wednesday the 31st of March on all bands, using CW and SSB. From Papua New Guinea, P20X will be active in the CQ WW WPX SSB Contest on Saturday and Sunday the 27th and 28th of March. From the United Arab Emirates, WD2DND will sign A61AD from Wednesday the 24th to Monday the 29th on all bands including 160m.

Rally news now, and we know of two events for today, Sunday the 21th and three events for next Sunday the 28th: The Norbreck Radio Rally, a Radio, Electronics and Computing Exhibition is being held today at the Norbreck Castle Hotel Exhibition Centre, Queens Promenade, North Shore, Blackpool. Doors open at 11.00am, or 10.45am for disabled visitors through a ramped entrance. There are over 100 trade stands, Novice Licence details and practical demonstrations, an RSGB stand and book stall, and a bring and buy stall. Free car parking includes a shuttle service. Refreshments are available. Talk-in is on channel S22. Also today, the Tiverton South West Radio Club Rally is being held at the Pannier Market, Tiverton, Devon. There is easy access, only minutes from junction 27 of the M5 Motorway. Doors open at 10.00am. There are the usual trade stands in two halls and a bring and buy stall. There is a mobile snack bar and free parking. Further displays and full refreshments facilities are available in the club-room bar. Talk-in is on channel S22. Next Sunday, the 28th, the Bournemouth Radio Society Annual Sale is to be held at the Kinson Community Centre, Pelhams Park, Millhams Road, Kinson, Bournemouth. Doors open at 11.00am. There will be amateur radio and computer traders, clubs and specialised groups. Refreshments will be available and talk-in is to be on channel S22 via G1BRS. Further details can be obtained from Ian, G2BDV, QTHR or by telephoning 0202 886887. Also next Sunday, the Magnum Rally will be held at the Magnum Leisure Centre, Irvine, Ayrshire. There will be the usual trade stands and a bring and buy stall. Details can be obtained from Peter, GM0FCI on 0294 72253. The last event for the 28th is the Pontefract and District Amateur Radio Society Annual Components Fair & Spring Rally, is to be held at the Carleton Commununity Centre, Carleton, near Pontefract. There will be trade stands, bring and buy stall, bookstall. Refreshments will be available. Talk-in is to be on Two Metres. Further details can be obtained from Colin Wilkinson, by telephoning 0977 677006.

Next the contest news:

The BARTG Spring RTTY contest started yesterday at 0200 and finishes at 0200 tomorrow, the 22nd, using the 3.5MHz to 28MHz bands. The CQ WW WPX SSB Contest is scheduled to run from 0000 on Saturday the 27th to 2400 on Sunday the 28th of March using the 1.8 to 28MHz bands. See March RadCom page 15 for further details. The RSGB 70MHz Fixed Contest takes place on Sunday the 28th of March from 0900 to 1500GMT. See February's RadCom page 66 for full details. The RSGB's First 1296/2320MHz Fixed Contest is scheduled for Sunday the 11th of April from 1600 to 2200GMT. See February's RadCom page 66 for the rules.

And now the solar factual data:

The period from the 8th to the 14th of March has seen a number of large M type flares, a proton event, and a Scottish type aurora, and more proton events are expected. Sun spot counts generally declined in spite of the flare activity. They meaned about the 100s, despite declining to only 75 by the 14th. A number of flares occurred almost every day, ranging from an M1.1/SF up to an M7.7/3B on the 11th. Further M7-plus flares were reported almost every day, sending magnetic levels up to 'storm'. SIDS, Sudden Ionospheric Disturbances, have occurred every day, though most have been short lived. A proton alert was issued on the 9th and it turned up on the 12th at 20.10 UTC, reaching a peak of 44 particle flux units on the 13th at 01.55 and ending at 12.45. The solar flux levels declined slightly over the period and averaged 146 units. The geomagnetic Ap index averaged 31 units, the highest level since last September. However, it was up to storm levels of 51 on the 9th and 43 on the 11th, with sub-storm levels still being reported as this bulletin was being prepared. The higher latitudes were most affected. Auroras were reported on 6 metres on the 9th, 11th and 13th, with the Lerwick beacon putting in a good signal to Yorkshire. The state has been proton alert, mag alert throughout the period. The radio quality indices not surprisingly declined to poor and were only coming back to normal by the 14th. The New York and Stavanger circuits were particularly poor. The aa indices, as supplied by the British Geological Survey for the 2nd to the 8th March, averaged 32.3 nanoTeslas for the daily levels, about K3. However, the 8th was disturbed, being up to 137 nanoTeslas around midnight. This is about K6. The only quiet day was the 5th which was down to 8 nanoTeslas, or K1. The X-ray flux has generally declined from B6.2 on the 11th, down to B3.2 by the 14th. The high energy particle input levels, as seen by the satellite, increased considerably up to the 9th, then steadily declined.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers, as reported by Meudon, averaged 9.3MHz, though the 8th and 11th were down to 8.3MHz with the magnetic disturbances. The darkness hour lows averaged 2.6MHz, though at times spread F was reported, lasting for 8 hours on the 11th with the auroras.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg have been seriously affected by the magnetic activity and only averaged 6.7MHz. The darkness hour lows averaged 2.8MHz. The ionosphere is affected by the seasonal changes, with the higher frequency DX bands being best in the winter months when a higher level of ionisation occurs. As the intensity of solar radiation directly affects the ionospheric levels, in theory the higher ionospheric levels ought to be in the summer. So far this F2 anomaly has not yet been fully explained.

And lastly the solar forecast:

This week, the quiet side of the sun will be looking our way. Solar flux levels are expected to be at about the 120s. On past history the geomagnetic activity is expected to be quiet to just unsettled. Ionospheric levels are expected to be about normal, with particularly north/south paths being open

during daylight up to 30MHz. The darkness hours should be open up to 18MHz. East/west paths are now becoming more difficult and 14MHz may be the best band.

And that is the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 Tango India and G7 Oscar Tango series, and Novice calls in the 2 0 Alpha Echo and 2 1 Bravo Papa series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Hi, I am brand new to Packet Radio. About all I really know is that Packet Radio involves an interface between Amateur Radio and a Computer.

I have found a piece of public domain software for Windows, but I still need the hardware interface that connects to my comm port.

I have many general questions. Is there a faq available for ftp? I have very limited space on the account my mail arrives in, so please don't send me huge posts, but I can ftp from another account.

What about a newsgroup? Or is that the purpose of the "Packet Radio Digest"?

Thanks,
Fraser Goodmurphy

Sure it does, it's just called LSB. :-)

>Is this a problem for HF packet ..??

It can be. The advantage of a rig with an AFSK position is that it
usually means that the filter center is repositioned, and the
bandwidth narrowed. That's not always true with all rigs, however.
Also, if the rig has passband shift, you can simulate the same
thing in LSB mode using a SSB narrow filter.

Does anyone know of a BBS locator database to find the
home BBS of a ham when you know his calls and state?
There ought to be a way to send packet traffic to someone
who has registered his or her home bbs with the sysop. I have heard
that there might be a database operated on one of the packet BBS that
you can query and would appreciate any reference to it...Thanks.

AX.25 assumes nothing about the nature of the underlying medium,
it can be used on wire lines as well. MacIntosh uses a similar protocol
for its LAN.

Hi folks,
Sorry to waste net.bandwidth, but I've managed to find the disc with my
distribution archive for 7-plus (8-bit ASCII encoder for packet) including full
source! And makefiles for Amiga/ST/Mess-DOS/Unix as well! Yippee! Anyway..

Who wanted it? I was supposed to be mailing it to someone, but I lost the
message concerned.. sorry!
Pse email me..

Frequently Asked Questions for Amateur Packet Radio

Version 1.13 - Last modified 2/21/93

This document is for unlimited distribution.

Please send corrections and additions to:
   packet-faq@wattres.sj.ca.us
Which will expand to a list of people who are familiar with most packet issues. I hope. ;-)

The Packet Radio FAQ's will be posted on a monthly basis to rec.radio.amateur.packet. The current version of this document is available via anonymous FTP at ftp.cs.buffalo.edu.

Many FAQ's, including this one, are available on the archive site rtfm.mit.edu in the directory pub/usenet/news.answers. The name under which a FAQ is archived appears in the Archive-Name: line at the top of the article. This FAQ is archived as radio/packet-faq.

There is also a mail server on rtfm.mit.edu, which can be addressed as mail-server@rtfm.mit.edu. For details on how to operate this server, send a message to that address with the word "help" in the BODY of the message.

1 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small bursts, or packets.

1.2 What is amateur radio?

Amateur Radio (sometimes called Ham Radio) is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions posting in rec.radio.amateur.misc. A copy of that FAQ is also available from ftp.cs.buffalo.edu.

1.3 What can I do on packet radio?

Keyboard-to-Keyboard contacts:

Like other digital communications modes, packet radio can be used to talk to other amateurs. For those who cannot use HF frequencies, two amateurs can talk to each other from long distances using the packet radio network.

Packet BBS operations:

Many cities have one or more packet Bulletin Board System (BBS) available on the local packet network. Amateurs can check into the BBSes and read messages from other packet users on almost any topic. BBSes are networked together over the packet network to allow messages to reach a broader audience than just your local BBS users. Private messages may also

be sent to other packet operators, either locally or who use other BBSes. BBSes have the latest ARRL, AMSAT, and propagation bulletins. Many BBSes have a file section containing various text files full of information on amateur radio in general.

DX Packet Cluster:

A recent development is use of packet radio for DX spotting. HF operators connect to the local DX Packet Cluster for the latest reports on DX. Often a user will 'spot' some hot DX and distribute the DX report real time.

File Transfer:

With special software, amateurs can pass any binary files to other amateurs. Currently, this is done with TCP/IP communications, YAPP, and other specialized protocols.

Satellite Communications:

Many of the amateur radio satellites contain microcomputer systems that can provide special information to amateurs. Some satellites contain CCD cameras on board and you can download images of the earth and the stars. Others provide store and forward packet mailboxes to allow rapid message transfers over long distances. Some satellites use AX.25, some use special packet protocols developed for satellite communications. A few transmit AX.25 packets over FM transmitters, but most use SSB transmissions.

1.4 Why packet over other digital modes?

Packet has three great advantages over other digital modes: transparency, error correction, and automatic control.

The operation of a packet station is transparent to the end user; connect to the other station, type in your message, and it is sent automatically. The Terminal Node Controller (TNC) automatically divides the message into packets, keys the transmitter and sends the packets. While receiving packets, the TNC automatically decodes, checks for errors, and displays the received messages. In addition, any packet TNC can be used as a packet relay station, sometimes called a digipeater. This allows for greater range by stringing several packet stations together.

Packet radio provides error free communications because of built in error detection schemes. If a packet is received, it is checked for errors and will be displayed only if it is correct.

With VHF/UHF packet, many countries allow packet operators to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBSes

(sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to use the same frequency channel simultaneously.

1.5 What elements make up a packet station?

TNC (Terminal Node Controller): A TNC contains a modem, a CPU, and the associated circuitry required to convert between RS-232 and the packet radio protocol in use. It assembles a packet from some of the data on the serial line, computing an error check (CRC) for the packet, modulates it into audio frequencies, and puts out appropriate signals to transmit that packet over the connected radio. It also reverses the process, translating the audio that the connected radio receives into a byte stream on the RS-232 port.

Most TNC's currently use 1200 BPS (bits per second) for local VHF and UHF packet, and 300 BPS for longer distance, lower bandwidth HF communication. Higher speeds are available for use in the VHF, UHF, and especially microwave region, but they often require unusual hardware and drivers.

Computer or Terminal: This is the user interface. A computer running a terminal emulator program, a packet-specific program, or just a dumb terminal can be used. For computers, almost any phone modem communications program can be adapted for packet use, but there are also customized packet radio programs available.

A radio: For 1200 BPS UHF/VHF packet, commonly available narrow band FM voice radios are used. For HF packet, 300 BPS data is used over single side band modulation. For high speed packet (anything greater than 1200 BPS), special radios or modified FM radios must be used.

1.6 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSMA (Carrier Sense Multiple Access). If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the TNC keys up the radio, and sends its packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet.

In actuality, a more complex scheme is used to determine when the TNC transmits. See the "AX.25 Protocol Specification" for more information.

1.7 What is AX.25?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified to suit amateur radio's needs. AX.25 includes a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the sender's and recipient's amateur radio callsign, thus providing station identification with every transmission.

1.8 Definitions: Commonly used terms in Amateur Packet Radio

44 net - The class A network designator for TCP/IP amateur packet radio. All numerical TCP/IP addresses are in the format 44.xxx.xxx.xxx.

AFSK - Audio Frequency Shift Keying. A method of representing digital information by using different audio frequencies modulated on a carrier.

AMPR - Amateur Packet Radio.

ampr.org - The high level domain recognized on Internet for amateur packet radio TCP/IP.

AX.25 - Amateur X.25 protocol. The basis of most packet systems. See section 1.7 for more information.

CRC - Cyclic Redundancy Check. The error detection scheme included in each packet. Verify that the packet was received error free.

CSMA - Carrier Sense Multiple Access. A system allowing many stations to use the same radio frequency simultaneously for packet communications.

digi - Short name for a digipeater

digipeater - A packet radio station used for repeating packets. See section 3.3.1 for more information.

FCC - Federal Communications Commission. Regulates and issues licenses for amateur radio in the United States.

FM - Frequency Modulation. The radio modulation scheme used for VHF and UHF packet communications.

FSK - Frequency Shift Keying. A method of representing digital information by shifting the radio carrier frequency different amounts to represent ones and zeros.

HDLC - (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

KA9Q NOS - (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

KA-Node - A simple networking scheme developed by TNC maker Kantronics. See section 3.3.2 for more info.

KISS - Keep It Simple Stupid. A simple interface developed for communications between TNCs and computers. This allows for most of the packet processing to be handled by the computer. Commonly used with packet TCP/IP software.

LAN - Local Area Network. A packet network developed for communications throughout a city or region. Often, the LAN uses separate frequencies from inter-city packet links.

modem - MODulator/DEModulator. Converts the analog signals into a binary data stream (a series of ones and zeros) for the TNC or a micro-computer. First step in decoding packets. It also converts binary data to analog, which is the last step in encoding packets.

NET/ROM - A scheme for packet radio networking. See section 3.3.3 for more information.

NODE - A network node. Often a network node running NET/ROM.

PPP - Point to Point Protocol. PPP is another protocol used for moving IP frames over a serial line. It supports host authentication, and non-transparent serial lines. It also has a standard way of negotiating header (and potentially data) compression over the line. See also SLIP.

protocol - A standard used for intercommunications between different computer systems.

RS-232 (RS-323C) - A (more or less) standard for interconnection of serial peripherals to small computer systems. In packet radio, RS-232 is the most common interface between TNC's and the Computer/Terminal.

SLIP - Serial Line Internet Protocol. A trivial protocol for putting IP frames over a serial line to do (potentially) cheap TCP/IP networking. Approximately the same as KISS, except over wireline networks. See also PPP.

SSB - Single Side Band. The radio modulation scheme used for HF packet

and satellite packet communications.

TAPR - Tucson Amateur Packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many others. TAPR continues development of packet radio equipment.

TCP/IP - Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more information.

TNC - Terminal Node Controller. See section 1.5 for more information.

1.9 Do's and Don'ts : Rules and Regulations

NOTE: These regulations apply only to amateurs regulated by the FCC (United States), but often are similar to regulations in other countries.

[Since I have no experience with amateur radio in other countries, I cannot make any comments. Please bring any notable exceptions to my attention. -ed]

Although there are no specific rules that apply to amateur packet radio, the general amateur radio rules force some restrictions on packet usage.

> Can I set up a TNC at home and one at work so I can check my Electronic mail via packet?

This cannot be done without special restrictions. Amateur radio rules prohibit any business. Since you could have mail from your boss (or maybe even someone selling you something over Internet), that would constitute business activity and is specifically prohibited.

Profanity can also be a complication. Since you have no control over the language used in E-mail, proper filtering is required. Since no filter scheme can catch every offense, it is best to say every message must be hand filtered.

> I would like to set up a packet radio gateway between a land line computer network and the packet network. Is this possible?

Yes, and there are several such gateways in use, but they must be managed with caution. Electronic mail may be passed FROM the packet network INTO the land line network without intervention. However, mail passed TO packet radio is considered third party traffic (the sender is not an amateur) and these messages must be hand filtered to ensure that rules of message content are followed.

> It's my license if I use packet radio illegally anyway, so what does anyone else care!?

Packet radio is one of the few NETWORKED systems in amateur radio. Many people have helped develop the network and there are many amateurs who own parts of the packet radio network. Sending packet BBS mail, digipeating, and sharing the channel involves the licenses of MANY people. Because of FCC rules stating that anything to come out of a transmitter (either in automatic mode or via your direct control) is the licensee's responsibility, one illegal message sent over the packet radio network could literally jeopardize the licenses of thousands of other amateurs. When in doubt, it is best to check with other amateurs about sending the message before it is sent.

> I have some ideas on how to use packet radio in a new way, but I don't know if it is legal. Who could tell me if I can do it legally?

The worst thing you can do is talk to the FCC about such an issue. The FCC rules are written to be general enough to encompass but not restrict new radio activities. In the past, any non-thought-out requests sent to the FCC have meant a reduction of privilege for all amateur radio operators.

The best source for legal assistance is your national amateur radio association. In the United States, that is the American Radio Relay League (ARRL). Another good place for such conversations is over Usenet/packet mailing lists, or the amateur radio BBS network.

2 Computing Network Resources for Amateur Packet radio

This section summarizes the resources available on Internet for amateur packet radio operators.

2.1 What Newsgroups/mailing lists are available?

This is a list of all groups that regularly discuss amateur packet radio. For newsgroups, join the group through use of your news reader. For mailing lists, add a '-request' to the end of the list name to request subscriptions. For listserv groups, send mail to 'listserv' at the node which contains the list. The first line of the mail should be 'SUBSCRIBE groupname yourname'. Send the command 'help' for more information.

rec.radio.amateur.packet (Newsgroup): General discussions involving Packet Radio.

rec.radio.amateur.misc (Newsgroup): General amateur radio discussion.

Usually does not contain any particular information about Amateur Packet Radio.

rec.radio.amateur.policy (Newsgroup): Discussion of regulation policies regarding every aspect of amateur radio. Occasionally deals with policies of packet coordination and legal issues of packet radio.

rec.radio.swap (Newsgroup): General For-Sale for any radio equipment. Occasionally will have packet equipment for sale. Recommended location for any amateur packet radio for-sale items.

info-hams@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.misc Usenet discussion.

packet-radio@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.packet Usenet discussion.

ham-policy@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.policy Usenet discussion

hs-modem@wb3ffv.ampr.org (Mailing list): Discussion of high speed modems and radios available and future plans. Also includes discussion of networking using high speed modems.

tcp-group@ucsd.edu (Mailing list): Group discussion of technical developments of TCP/IP over packet radio and use of the NOS TCP/IP programs.

gateways@uhm.ampr.org (Mailing list): Discussion of current gateways and future plans for gateways. May deal with sensitive internetworking issues.

listserv@knuth.mtsu.edu has several interesting mailing lists available:

GRAPES-L	Discussions with GRAPES (Georgia Radio Amateur Packet Enthusiasts Society) on 56kb WAN's and the WA4DSY 56kb RF modem that they distribute.
TENNET-L	Tennessee's efforts at a coordinated high-speed RF packet network
GRACILIS-L	Discussions on Gracilis tcp/ip packet equipment. Includes some of the people from Gracilis.
KA9Q-UNIX	Discussions on porting and using various versions of KA9Q Unix/Xenix NET/NOS under any of a variety of Unix/Xenix variants.
TNV-HAMS	General discussions amoung email connected amateur radio operators in and surrounding Tennessee

Send a message with a body of "HELP" to get help from the list server. Also,

Internet users may now INTERACTIVELY work with the ListServ there by:

    telnet knuth.mtsu.edu 372

        or

    telnet 161.45.1.1 372

For all lists at ucsd.edu, archives may be found via anonymous FTP at ucsd.edu. Some listserv groups also have archives. Send the command 'help' to the group's listserv for more information. Digest mailings for the ucsd.edu discussions are also available. Send mail to listserv@ucsd.edu with the first line being 'longindex' for more information.

Terry Stader (KA8SCP) <tstader@aol.com> maintains a list of Mac packet-related software, and posts it periodically (somewhat less often than monthly) to rec.radio.amateur.packet.

2.2 What anonymous FTP sites are available for getting packet radio information and programs?

This is a sampling of FTP sites that carry amateur packet radio related files. Consult the Archie archive server for info on locating particular files. For more information on using archie, send mail to archie@cs.mcgill.edu with the line 'help'.

ucsd.edu

Primary distribution site of KA9Q's derived TCP/IP packages. Also, general packet radio information in the /hamradio/packet subdirectory.

wsmr-simtel20.army.mil

Very large collection of amateur radio software.

wuarchive.wustl.edu

Mirror site of Simtel20 archives. Unix directory structure, which is easier to use then the simtel20 archive.

ftp.cs.buffalo.edu

Supplimental archive site for amateur radio information. Contains current copies of all rec.radio.amatuer.* FAQ's.

tomcat.gsfc.nasa.gov

Packet software including Baycomm, ROSE, G8BPQ, NOS, etc.

akutaktak.andrew.cmu.edu

SoftKiss for the Mac, in /aw0g. Requires NET/Mac.
SoftKiss is an init/cdev/driver that allows a MAC to do packet using
a Poor Man's Packet modem.

sumex-aim.stanford.edu

NET/Mac is the port of KA9Q's NET program. It doesn't have nifty features
like scrolling or saving the windows, but the individual sessions can be
recorded into a file.

2.3 How do I contact the ARRL via electronic mail?

There are various addresses at ARRL HQ, but the most important one is
probably info@arrl.org. That is where general information about the
ARRL can be acquired. This address reaches a person, so you'll have
to specify what/who you're looking for.

2.4 Are there any gateways for mail or news between Internet and
Amateur Packet radio?

Internet / Packet Radio BBS Gateway

Jim Durham, W2XO, maintains a gateway between Internet and the Packet
radio BBS system.

To mail from Internet to Packet:

1.   Mail to: "bbs@w2xo.pgh.pa.us"

2.   Make the first line of the text a Packet BBS "send" command, ie:
SP TOCALL @ BBSCALL.ROUTING-HINTS < FROMCALL

3.   The "subject" line of the Internet mail becomes the "title" line
of the Packet BBS mail.

NOTE: Because of FCC regulations, Jim must hand filter each message
sent FROM Internet TO the Amateur Packet Radio BBS system. Messages
should be of minimal length and appropriate content. Read Section 1.9
(Do's and Don'ts: Rules and Regulations) regarding appropriate usage of
packet radio for more information. Always include the routing hints
with the BBS callsign.

To mail from Packet to Internet:

1.   The amateur radio operator must have his callsign registered in
the gateway alias list. If you want to mail from packet to a specific
amateur on Internet, send mail to 'durham@w2xo.pgh.pa.us' (Internet) or
'W2XO @ W2XO.#WPA.PA.USA.NOAM' (Packet BBS mail) with his/her amateur
callsign and their Internet address.

2. Once the above is accomplished, packet BBS mail should be sent to 'CALL @ W2XO.#WPA.PA.USA.NOAM'. The mail will automatically be forwarded to the Internet address of the amateur with the 'CALL' callsign.

Jim Durham's Internet address is 'durham@w2xo.pgh.pa.us'.

LAN Gateways (Packet wormholes via Internet)

Currently a group of amateurs are experimenting with connecting packet LANs together via Internet IP inside IP Encapsulation. Some of the gateways only accept TCP/IP packets, others AX.25 packets. These gateways uses the Internet as a transport medium, thus it is impossible to access the packet radio network from Internet. For more information, join the Gateways mailing list by sending mail to "gateways-request@uhm.ampr.org".

3 Networking and special packet protocols

This is a sample of some of the more popular networking schemes available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.

3.1 Are there any other protocols in use other than AX.25?

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.

Often, special packet radio protocols are encapsulated within AX.25 packet frames. This is done to insure compliance with regulations requiring packet radio transmissions to be in the form of AX.25. However, details of AX.25 encapsulation rules vary from country to country.

3.2 What is TCP/IP?

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different

computers such as the Amiga, Macintosh, Unix, and others. Smaller computers like the Commodore 64 and the Timex-Sinclar do not currently have version of NOS available.

3.3 Networking Schemes

What are some of those other networking schemes?

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network schemes where created.

Digipeaters

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if its call was in the digipeater field, would resend the packet. Digipeaters allow the extension of range of a transmitter by retransmitting any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.

KA-Nodes

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgement, KA-Nodes allow for more reliable connections with fewer timeouts, because acknowledgments are only carried on one link. KA-Nodes therefore are more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.

NET/ROM

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM station as if connecting to any other packet station. From there, he can issue commands to instruct the station to connect to another user locally or connect to another NET/ROM station. This connect, then connect again, means that to a user's TNC, you are connected to a local station only and its transmissions do not have to be digipeated over the entire

network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM doesn't use all of the AX.25 protocol. Instead, it uses special AX.25 packets called Unnumbered Information (UI) packets and then puts its own special protocol on top of AX.25. This is again used to increase efficiency of its transmissions.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, MSYS, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network. However, if band conditions such as ducting occur, ordinarily unreachable nodes can be entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route to a distant node manually defining each hop instead of using the automatic routing feature.

ROSE

ROSE is another networking protocol derived from X.25. Each ROSE node has a static list of the nodes it can reach. For a user to use a ROSE switch, he issues a connect with the destination station and in the digipeater field places the call of the local rose switch and the distant rose switch the destination station can hear. Other then that, the network is completely transparent to the user.

ROSE's use of static routing tables ensures that ROSE nodes don't attempt to route packets through links that aren't reliably reachable, as NET/ROM nodes often do. However, ROSE suffers from the inability to automatically update its routing tables as new nodes come online. The operators must manually update the routing tables, which is why ROSE networks require more maintainance.

3.4 BBS message transfer

Many of the BBS programs used in packet radio allow for mail and bulletins to be transferred over the packet radio network. The BBSes use a special forwarding protocol developed originally by Hank Oredsen, W0RLI.

Besides full service BBSes, many TNC makers have developed Personal BBS software to allow full service BBSes to forward mail directly to the amateur's TNC. This allows operators to receive packet mail at night and avoid tying up the network during busy hours.

From: Aaron Wohl <aw0g+@andrew.cmu.edu>
Subject: softkiss 1.6/macintosh packet driver
Lines: 98

Softkiss is a device driver/control panel for the macintosh. It lets
you use a cheap modem to get your mac on packet. See oct 92 edition
of 73 magazine for more details. Softkiss was written by
Aaron Wohl (n3liw+@cmu.edu). The major changes since 1.2.x are, support
for kiss parameter changes and fixes/debugging support for a lockup
problem.

Jim Van Peursem (jvp@cpre1.ee.iastate.edu) just started shipping savant.
It is an all new mac program to do ax25 connections with a tnc in
kiss mode. I switched to using savant from macnet and like it a lot.

Softkiss is available via anonymous ftp from host
akutaktak.andrew.cmu.edu [128.2.35.1].

/aw0g/softkiss.1.6.sit.hqx   - Get this to run softkiss
/aw0g/softkiss.src.1.6.sit.hqx   - Get this to modify softkiss sources

*** I recieved zillions of mail messages about softkiss and
*** suggested changes to the user manua. I am
*** only now digging out of the pile sorry for the delay

Changes in 1.6 March 20 1993
  Allow numbers to be type in as hex eg $a
  Rewrite transmit interupt handling
  Have scc abort outgoing packet if interupts are off for two long
     Variable xmit_overrun displays the number of times this has happened
  Fix debug output code to handle large monitors
  Fix: Sometimes kiss mode wouldn't work unless tnc mode was used first
  Copy 8530.h from KA9Q's nos to get nice names for the scc registers/values

  Users have reported lockups after running SoftKiss for a while.
  The SE/30 and FX I work on don't lock up for me.   I rewrote some of
  the interupt code mentioned above and enabled the debug command
described bellow.

```
  Hopefully the lockup problem is fixed, if not turn on debugging and
let me know
  what you see when it locks up.  Perhaps it is still getting interupts
(perhaps
  continously causing the lockup).

  Enable debug command, used as debug_level 1
    Only turn debugging if the primary monitor is in two bit mode
    With debugging on the driver writes output to the screen memory from
      interupt level.  Move your windows over to the right so you can read
      the softkiss output.
    Each softkiss channel has it's own area of the screen for output.
    As the finite state machine changes state the state numbers are written
     out.  State numbers:
              0 port offline
              1 RX mode
              2 RX of packet in progress
              3 RX but throw away data
              4 waiting for dwait/slottime to expire
              5 keying up, sending flags
              6 transmiting
              7 sending trailer
     On an external/status interupt the active status info is written out:
          a - abort
          u - transmit underrun
          c - cts (carrier detect on HSKi input)
          h - hunt mode fount sync character
          d - DCR input (GPI input or mouse on mac+ or ...)
          z - Zero count in baud rate generator
     On a recieve interupt the recieved character is written out
     On a transmit interupt the sent character is written out
     On a special interupt 'S' is written out

     If you are changing the SoftKiss sources you will need to make
     a StrictMacHeaders file.  Copy the "Mac #includes.c" file that comes
     with think c and in the line:
#define SIMPLIFY_PROTOTYPES     1
     change the 1 to a zero.  Use the "Preproces..." command from the source
     menu and save the result in the same folder as MacHeaders but call
     it StrictMacHeaders.  When softkiss is built this is used to be as picky
     as possible in reporting type mismatches.

     If you are adding new commands to softkiss let me know, it pretty
     strange right now and I haven't documented it.

Wish list:
Finish updates to manual
Comm toolbox support
Finish single character foreign language support
Finish digipeat and cross channel digipeat
Finish .ax25_packet driver interface

Changes in 1.4
```

Support kiss commands for savant

Changes in 1.2.3a0
Users where running macnet then trying to run an emulator at the same time.
  So if a serial port is already open refuse to open again.
Check the port in use bytes sooner so we don't fight with appletalk.
Partial foriegn language support, move all strings from driver to resource.

Changes in 1.2.2a0
Add a wireing diagram for Tigertronics BayPac modem
Fix DCD interupt handling so the mouse works on a mac+

Hello,

 I don't know if this is a good newsgroup, but I can't find better :-)
I have a simple question: Is possible to build transfer on 1-5 GHz for
routing and bridging between ethernet TCP/IP lans ?

On our university we have a trouble with building university WAN, because
we have buildings throught all town. Is impossible use optical fiber.
Currently we use simple modem transfer on 19200bps with routers, using
KA9Q software. It is very slow and useless.
 I have read article in Computer World about radio transfer
on frequence from 1 to 10 GHz a transfer speed about 1 - 10Mbit/sec.

Please, Can you write me about his. Is it possible? What's problems ?
Any comment and reply will be great.

Thanks

              Richard Vanek

Hi there, I've been trying to find some documentation on
how and with what s/ware you burn in hex codes into an
eprom, but with no success. Anyone know of anything to help?

I notice some hex code on ucsd.edu in tnc2118a.zip but there
is no source. Is the .asm source available? Also the jkiss
hex code. Can't find the .asm source for that either.

Also logging software. I've found lan-link. Is that suitable
for use with NOS ala ka9q? If not is log-eqf and if so where
can I get that from? I can't find it via an archie session.

Basically I'd like peoples opinions on what is the best software
for electronic packet logging and where I can grab it from.

Thanks in advance

Hello everyone!

My freind DF3CB recently purchased new software for his KAM which
he is now using for RTTY/AMTOR and
Pactor. Unfortunately he did not
receive the new terminal software named

   HOSTMASTER 2+

with the Pactor mode. Can someone help us out on this?

Here is a list of equipment that is up for sale. Remember, if you are interested:

- You will be asked to sign an "AS IS" agreement.
- Units have been tested and in many cases have
  very little air time.
  - If you are paying by check, a 1 week waiting period
    will take place before product is sent. If you are
    paying by bank check,
    the radio will be sent immediately. Radios are sent insured
    and certified
    if you request.
  - All radios have been used for diagnostic testing and have been modified.
  - You will incur all postage,insurance and or/certification.

I have received alot of mail for radios, and you will save on good used equipment. I have consulted with Alinco over the years and wrote soem of their Domestic manuals. There are radios I have that are damaged and they are not included in this list. This is the best of the bunch so here we go.

Mobile Radios
---

1 - DR-590 Original vintage and does not have the upgrade. I believe the upgrade is 50 dollars. The problem areas are PL tones and some functionality via the mic. The mod basically fixes all known problems. The radio is in good condition and has about 25 hours of use. Includes Microphone only. Encoder is standard and Decoder is not included. This is a dual bander 2/440. $295.00

1 - DR1200 data radio. Never been used and includes microphone cable with tinned leads for packet hookup. This can be used for 2 meter operation and would need a mic. $175.00

2 - DR599 Dual Bander, good condition and comes with decoder. Each radio has about 30 hours of air time. Comes with power cord and microphone. 2m/440band $480 each unit

Handheld Radios
---

1 - DJ580 Dual band handheld. Just received latest IC upgrade. Comes with trickle charger and battery. Encoder/Decoder included 300.00

1 - DJF1T 2 meter handheld, very durable with battery. WITH Encoder/Decoder 200.00

1 - DJ460 440 handheld with battery, Encoder 110.00

1 - DJ560 dual bander with battery, Encoder/Decoder 200.00

no airband

1 - DJ160 2 meter handheld with battery, 130.00
Encoder/Decoder

1 - DJ162 2 meter handheld with battery/airband 155.00
Encoder/Decoder

All handhelds are as is and operate. These radios were used to test DSQ functionality between different radios. They "in some cases" were used for the manual re-writes. The DJF1T was the only radio used in drop tests from 5 feet. If you know the radio, you know that this is hardly an issue.

I still working on the price list, but feel free to make an offer where you see fit. All radios are sold as is. You are encouraged to make an offer. First reasonable offer gets the radio. Many thanks to all of you for your feedback over the years.

Earlier I had attempted to use the group to get some advice about good
starting points on equipment for starting in packet. None of the information
I asked about was contained in FAQ. I got no response at all.

I'll try again but will only ask questions on a single topic in hopes of
getting a fast answer.

If you were starting out in VHF packet would you get an AEA PK-88 or
a Kantronics KPC3. I know the PK-88 has a 1200 baud modem included
does the KPC3? What are the advantages of one over another.

Sigh. Too many implementations and not enough documentation.

I'm using KA9Q 930118 from ucsd.edu, and my basic configuration is working OK.
Now it's time to add bells & whistles like autodialing. What do I need
flag-wise on the "attach" command, what does the "dial" command do, and what
is the format of the "dial" command's 3 script files?

I cannot find these answers in the docs I've obtained so far.

Thanks for your assistance!

N9LNQ in East Central Illinois has been running FBB BBS version 15.5 for
about two weeks, and something strange is happening to the time/date stamping
of messages... the message time/date stamps seem to get "randomized".
It is not clearly related to a European vs. US date formatting error.
Messages posted on dates 3/20/93 will turn up with May and April dates
within a few days.
Jim first thought that this might be caused by a utility program that he
runs overnight to convert special messages to files for future reference,
but he doesn't think so at this point.

Any clues for solving this problem would be appreciated. I will relay them
to Jim.

Fred,
Its no problem, and there is really no AFSK mode. It just means that the
tnc is generating the tones that simulate FSK. All tncs come with an
audio output, which wires to the mic jack on the radio. You just put the
radio in LSB and type away! If you want FSK, you would have to wire the
FSK lead from the tnc, and adjust the radio to the proper shift. I use
true FSK on hf packet, which really doesnt make that much of a difference,
at least none that I have noticed. It just allows me to use the more narrow
IF on my radio when it is in FSK mode rather then LSB using AFSK, and to
use true FSK on rtty, where is supposedly makes more difference.

Good luck..
Charlie

I have a KPC-3 and have no similar problems. I leave mine on all the time
and constantly stay connected a local PacketCluster. Although i have never
repeatedly connected and disconnected the serial line. It sounds that you
might be getting a slight short at the time of the disconnection, or you
are forming some sort of ground loop. It also depends on whether the
receive buffer is full. If you leave the tnc on, and no terminal connected
the buffer will continue to receive, but the info cant be passed to the
terminal, so it will back up in the buffer, and when it gets full, it'll
just send <rnr> frames. But if the PTT light is coming on, it should be
keying the radio, regardless of whether there is a terminal connected or not.

BTW: I would NOT recommend connecting and disconnecting the serial line
while the tnc is powered on anyway, because you are just ASKING for a short
of some type. My KAM is extremely sensitive to this very thing.

Charlie

TAPR. The MFJ eprom will "jump" out of kiss mode if left unattended for too
long. Just get TAPR's eprom code, it works great, and all you lose is the
mailbox.

I am having setup problems on transmit for PMP.
The PMP works great on recieve but the transmitted
packets seems to be ignored by other TNC's.

I have tried this system with three computers, with the
same results.

Any help will be greatly appreciated.

European CB is normally FM and limited to 4 watts, I think. In the
Netherlands packet is permitted and there is a thriving community
using it on two main channels, including a mail forwarding network that
covers most of the country. The CB operators employ the same tnc's and
software that hams use for 1200 baud work on 2m. It's crowded and
subject to lots of interference but still works.

The illegality (well...) lies in your use of the Internet, NOT your
use of the Amateur Radio Frequencies. It is not within the acceptable
use policy of your regional network to provide services in exchange
for funds.

That, I think, is why the message was sent to your sysadmin, and not
the FCC.

Of course, That's just my opinion. I'm not involved. But, I think that
the HAM end of things should pay for the station, that's fine. But
when you solicit or engage in fund gathering over the net, you are
in violation of policies..

Erich, I can't get a message back to you! Your address header is invalid to my
 system. ???
In answer to your question about software for the KPC3:
     I have used many of the shareware programs available on ham oriented bbs's
with good results. Paket 5.1 is my favorite, and Lan-link 2.00 is a second cho
ice. Hostmaster II+ is very good. It makes things easy for the beginner.
     1200 baud packet is all there is out here in the sticks of North Dakota, b
ut we find that it works very well. It would be nice if everyone was on 2400
baud, but they're not. Anyway, good luck on whatever you decide.

*** to all the net: Sorry to post this like this, but it is the only way that
I can get back to Erich! ***

If you would have really read the first message and the above
message and understand part 97 too, you would understand that
we are not "charging" money for services! WE *can't* "charge"!
We are asking those who *like* this service to support it.
>

What about shareware? It's asking for funds - use internet to
FTP my software, and if you use it, you *must* send me money
or break the law! Sounds like "solicitation" under your
definition... "providing services in exchange for funds", eh?
What about the new disk that was bought for the sumex-aim.
stanford.edu macintosh archives? That was "solicitation"
for a service, namely, the new disk for archives ...
Please note that none of these were *commercial* services.

The point is that, like shareware, here are some people doing
(IMHO) a good thing and are asking for those who like and
use this service to help support it. This happens all the time,
just that the people providing the services in internet are
usually programmers, not hams.

Well - There has not been much said about the DSP multimode TNC from AEA
     recently. I presently have a PK232MBX - which I am very happy
     with. Now I understand that the Pactor upgrade is available for the

232 and the DSP units. I have been contemplating upgrading to the DSP unit since I am very interested in the opportunities it (dual port unit) offers. However, I've held off due to cost and the fact that little has been said about the units on this Newsgroup. Now I am in a position where I must decide to go for the 232 Pactor upgrade, or hold off and get the DSP unit later this summer.

So - With respect to those who currently have or have used the AEA DSP units-

1. Are you happy with it?
2. Is the software available to take advantage of the units capabilities?
3. What are the problems if any with the units and would you get it again - or would you recommend that I stay with the 232 and upgrade it?

Thanks for your time and consideration in answering this request. It sure has been quiet re - the DSP units. Replies may go to me direct or the group. As always - I'll summarize if replies are received.

I've been looking at the ka9q code and have found some
lapb-level bugs. Does anyone care enough that I should
post them? I presume if they were a problem, they'd have
been corrected long ago (they look like they've been
there a long time). Or alternatively, is there someone
somewhere in charge of maintenance who should be informed?

Hi,
     the ka9q port I have sends out on a system V (SYN) but does not
receive. Have I got the calling sequence wrong. Or not set the address,
gateway, netmask, ip address.

Question: How do I set all of these and how do I debug it.

     Thanks,
     erach (irani@cs.umn.edu)

A more verbose description follows:

1. login using kermit to the slip server. Disable DTR n the modem.
get the slip ip address and the MTU and the gateway address.

2. exit kermit. modem is still on

3. enter net.debug
net> is the prompt

say
attach asy 0 /dev/ttyh01 slip sl0 256 1500 9600

here i have the option of having dialer commands after 9600
but those don't push thru.

set the ip address of the station:

question --- do I set it to the ip address of the station or the ip
address of the slip server

command
ip [address ?]

then
set the slip address on the other side

route add [slip-address] sl0

add gateway

route add default sl0 [gatew-ay -address] 1

question: how do I add the netmask
255.255.255.0

I did a grep in the source code cannot find anything

nor can I find 'up' for the interface.

then telnet to address in outside world or local-address

problem: sends SYN but nothing received.

Is there a way to debug this. Thanks,
     erach

Using FSK mode on radios rather than AFSK via SSB mode on rig:

Reasons to run FSK:

1. "CW" narrow filters can be used in digital modes. Baudot RTTY works just
    fine through 500 Hz and 250Hz filters. For RTTY contesting this is a
    big help.

2. Audio levels into the rig: with FSK the audio level from TNC to radio is
   important. Overdriving the rig will result in splatter. FSK does not have
   this problem, since the rig takes care of generating appropriate carriers.

3. Mark frequency display: Rigs which have RTTY/Packet/FSK modes (called
   different things by the different manufacturers) display the MARK TONE
   frequency when in FSK mode. This is a BIG PLUS if you want to use the ALPINK
   systems or other HF automatic services. ALL of these are advertized based on
   the MARK frequency. It is possible to figure this out on an LSB display, it
   is just less convenient.

Notes:

   You may find FSK mode problematic for modes which do not use 170Hz shift, since most rigs are set up for that. And while most rigs are switchable, it is not generally convenient to do that switching very often.

I run primarily Baudot RTTY and Amtor, and have little use for HF packet. My station is optimized for RTTY...

I have had several requests for this by email so I thought I'd post it.

I think the following files used to be at ucsd.edu but I cannot find them there now.
message.

Not hard to build and works very well.

73 Greg KD9AZ

First a few comments by KD9AZ:

1) This is a popular design of a Baycom modem using the TI TCM3105 chip. It is nice because it is a CMOS chip and draws very little current so it can be powered by the RS232 port (usually done with RS232 pin 2 (from 25 pin connector) through a diode and a regulator chip like 78L05). I chose to do this differently: I used the AMD7911 chip which is bipolar and needs both +5 and -5 supplies. I used my own power supply, which is advantageous for the RS232 driver (see next comment). I like this chip because it can be jumpered for either 1200 baud or 300 baud (which is the speed for HF packet!).

2) This design uses TTL HC chips to receive and drive the RS232 lines. This is what the Baycom authors recommend. It works with some computers and not with others, depending on what the RS232 receiver chip used in the COM port is. It did not work in my computer so rather than buying a new COM port I redesigned the interface. I used MC1488 as an RS232 driver (it requires +12 and -12 volt power supplies, again, not compatible with deriving the power directly from the COM port) and an MC1489 as an RS232 receiver. This is fully compatible with the RS232C spec and should work with COM ports on all computers.

The next section is the parts list for the TCM3105 schematic:

BAYCOM MODEM

DL8MBT & DG3RBU April 1990 (updated October 1992, KD9AZ)

Hello, I am a newcomer to the world of TNC's and I have recently
connected a MFJ-1278 to my ICOM 745 Shortwave radio.  What I need
now is some software that is easy to use that allows morse code,
RTTY, amtor, etc to be decoded using my MFJ-1278.  Is there some
shareware that can be ftp'ed from somewhere.  Any suggestions would
be much appreciated.  Please send suggestions by e-mail.  Thanks,

Karen M. Moss

How can anything be considered "illegal" on a service that has no enforcement until it interferes with another service?? How could packet radio be construed as anything other than another one of the many noise makers that have been in vogue on 27 Mhz for a number of years??

I would think the FCC would be pleased to see someone other than hookers and small-time drug dealers actually making some serious use of the band.

> what didn't it do before?

Its basically a freeforall on the ka9q code anymore. There are
so many different versions that its hard to make a standard.

Also there are mailinglists but they are so far into debate right
now nothing is getting done.

This is the place to make your stand and I for one would like
to see the bug fixes posted since my mail routes are all so
messed up because of admin problems down the road.

Erich, i tried to mail to you but was returned as unknown. Anyway,
we use highspeed packet on a local basis to great satisfaction. Most of
us run TCP/IP mailboxes, and for binary transfers to each other.. Works great.
They use 19.2 on TexNet in southern Texas, and that i have heard works great,
somtimes!   As for the 741 as a base station, i should not see why not, i use
a 241 as a mobile and as a base station. Only thing i dont like about the
741 is that modular plug, makes it kinda hard to wire tncs. I dont think it
will work on highspeed packet either, because of it being Phase modulated rather
then true FM. If you can get that mod plug, you should have no problem wireing
the kpc to it at all!

>the pros and cons of Baycom and Poor Man's Packet? Is Poor Man's
>Packet better than Baycom with the A&A modem? How does Poor Man's
>Packet work?

1) I don't know anything about the A&A modem.
2) Both Baycom and PMP are software TNC's designed to work with a simple
  modem circuit based on the TCM3105 modem chip. Both work with PC's.

3) Baycom uses the serial port for talking to the modem circuit. It was
  written by some German guys... it has an extra "monitor" window to allow
  you to monitor packet traffic while you are connected. The documentation
  is poorly translated from German. It is not compatible with some PC serial
  port hardware (including mine, I think), and there is no source code
  available.
  Because Baycom uses the serial port, the modem circuit requires an extra
  "buffer" chip to bring the RS232 +/-12 V line levels down to TTL (?) levels
  (+/- 5V) for the modem chip.

4) PMP uses the parallel port to connect to the modem circuit. It was
  written by Andy Payne while he was at Cornell (N8KEI), and the complete
  C source code is available for it... with some well-modularized sections
  on AX.25 packet handling. Because the parallel (printer) port is already
  a TTL level port, a buffer chip is unnecessary between the computer and
  the modem circuit. (Kevin Feeney (call?) was the hardware designer for
  this circuit... PMP was described in a July 1991 (?) 73 magazine article.)

5) I use PMP, and am happy with it. It uses the full available working
  memory on your machine to store the traffic scrollback buffer... it allows
  you to save the entire scrollback buffer to a file or to turn file capture
  on and off at will. It uses bold lettering to distinguish the commands
  that you type from the traffic that is flowing on your screen... it keeps
  track of error statistics which you can view at will as well as a heard
  buffer which you can view at will. There is also a cute little packet
  queue status display to show you how many packets are outstanding
  (pending acknowledgement).
  If I could change it, I would find some way of allowing the user to
  escape to DOS briefly to get file directory listings or for composing
  messages to upload (which can be more efficient than typing them
  interactively when there is a lot of traffic, because you can't type
  when PMP is trying to decode packet traffic). Otherwise, I am quite
  happy with PMP...

6) Some day I would like to give Baycom another try. I use the Ramsey
  packet modem kit which can be wired for both Baycom and PMP at the
  same time (I think).

Does anyone know of a software package that can analyze packets received
using a TNC in KISS mode?

We have a local packet-type signal that I would like to identify. It
appears to be 1200 baud, BEL-202 (1200/2200), but possibly non-NRZI. I
was hoping to locate something that could at least determine the call sign
of the packet station, not necessarily the information in the packet.

I use the Hamtronics *helical* filter preamp externally for use with the repeater MVP. Their unfiltered preamp crunches badly in high RF sites and the optional GE preamp is of little use. The Hamtronics helical unit is superb once you get it tuned right. Tune for best SNR not best gain.

>under some circumstances, but I don't think it is optimum.

Argh! Comes from posting when sleepy. The CG input will be pre-emphasized by the phase modulator of course. However, this doesn't appear to be as big a drawback as we've thought. While there can be no DC component to a PM modulated signal, using the CG input does allow very low frequency AC components to pass. That seems good enough.

There remains a potential interoperability problem with FM radios due to the different "twists" introduced by bypassing pre-emphasis in the *FM* modulators. If the FM rigs don't bypass pre-emphasis, their received output at the discriminator is identical, except for any DC component, to that of a PM modulated signal. The problem, of course is getting proper and consistent pre-emphasis all the way down to near DC. With PM it's automatic, but with FM it's difficult. Therefore it isn't normally used with 9600 baud FM radios, and therein lies the interoperability problem.

The MVPs seem to work ok in a consistent network, but mixing in FM radios may cause problems. The extant modems would rather see a flat power spectrum as well, so effective range is limited with PM rigs because of the degradation in modem response caused by the twist unless a de-emphasis filter is used on the output. Now the same problems of low frequency response plague these filters too. With strong signals this doesn't seem to be a problem, but when the signals drop below 20 db quieting the error rate goes up quickly. We tend not to engineer such marginal paths.

An ideal de-emphasis network in front of the PM modulator would seem to be the answer. While that's hard with simple RC networks, an active opamp based roll off filter should do the trick. Again I would note that true DC response *seems* to be a non-issue under normal conditions with a data scrambler. That's just a real world opinion with no theoretical backing.

The MVP is such a good radio in high RF environments that it would be worthwhile to convert it to true FM if that seems necessary. The temperature compensation input is the obvious choice, but it's response is both limited and somewhat non-linear. A different varactor and bias network should solve that, though temperature compensation would

now be wrong, seems a good place for another opamp used as a weighted summing network.

The plastic cased Maxars don't seem to hack high RF sites very well. I have a few, but won't put them at sites with high power transmitters, the Micor is a better Motorola choice, but it's somewhat bulky. We're working with small GE tower cabinets and the small size of the MVP is very valuable.

Gary

Dana, we are using UHF MVPs locally for 9600 baud packet with no difficulty. They interoperate with the Yaesu FT736R equipped with mods for the 9600 baud pacsats.

The Phase modulation concern is unwarranted ... you'll want to bypass the modulator completely. We supply the nb-96 modem output, with a DC bias added, into the temp comp input of the xtal pkg. We looked at the spec and saw that the temp comp. would be unlikely to get activated at temps encountered in La. I can supply actual details if needed.

I do see some drift but only because my ft736 has a discriminator
meter! I equipped mine with 20 kHz IF filters and it works fine with the
MVP.
